Table S4. Mutation rates estimated based on ML and Bayesian methods.

tRNA were relatively conservative. In the protein coding region, the third position showed the highest rate as was evident for the non-coding region, while the second position evolved slowest due to its high effect on amino acid change.

Figure S1. MtDNA coverage distribution of the 119 *S. japonicum* samples used in the analysis. Note: Average coverage (black line) with 5% and 95% quantile coverage (dashed lines) for each mtDNA genome assembled in the study.

Figure S2. Variation distribution across the mtDNA genome of S. japonicum.

Note: The diversity and substitution were counted and calculated every sliding window of 200 bp (step size = 50 bp) along the entire mtDNA genome.

Figure S3. Detailed phylogenetic tree based on the mtDNA sequences of 119 *S. japonicum* samples. Every mutation is denoted to each haplogroup. Insertions are represented as '.'. Deletions were added as 'd' at the end. Blue denotes non-coding mutations. Red indicates synonymous mutations while Black means nonsynonymous mutations. Green indicates tRNA and rRNA variants. Refer to Table S1 for the abbreviations of each sample. (See supporting file 1)
