

S2 Fig. Onset and Duration of Visual Field Response in Responding Eyes by Patient.

Response was defined as an increase in functional retinal area for the primary isopter from baseline of $\geq 20\%$ at two or more consecutive visits within 2 months of treatment. Symbols represent time points at which visual field assessments were performed. Duration of response (shown by the horizontal lines) is the period over which the patient's functional retinal area remained above the response criterion of a $\geq 20\%$ increase.
