Supplementary data introduction

Table S1 Statistical results of the RNA-seq experiment.

Table S2 List of the transcripts highly accumulated in specific organs (root, flower, stem or leaf) of *Dendrobium officinale*. The transcript IDs along with their expression levels (normalized in RPKM and rescaled by log10) in four organs are included in this table. For each organ, there are two biological replicates (“Root1” and “Root2”, for example). ND: not detected.

Table S3 List of organ-specific transcripts potentially involved in specific organ-related biological functions.

Table S4 Organ-specific sRNAs identified in *Dendrobium officinale*. The sRNA sequences along with their accumulation levels (normalized in RPM) in sRNA-seq libraries prepared from specific organs were included in this table. Seven miRNAs were identified to be specifically accumulated in the floral organ.

Table S5 List of 1,047 miRNA candidates identified from *Dendrobium officinale*. The miRNA candidates from *Dendrobium officinale* along with the homologous miRNAs from other species sharing identical sequences according to miRBase (release 21) are provided. The accumulation levels of the miRNA candidates in the sRNA-seq libraries prepared from four organs are also included in this table. For each organ, there are two biological replicates (“Root1” and “Root2”, for example).

Table S6 A partial list of miRNA--target pairs identified from *Dendrobium officinale*. The miRNA IDs, target transcript IDs, target length and target annotations are included in this table. Based on the functional annotations of the target transcripts, the miRNA--target pairs were classified into four functional groups (hormone signaling-, plant development-, secondary metabolism- and Argonaute 1-related groups) for

network construction.

Figure S1 Statistical results of the sRNA-seq experiment.

Figure S2 Certain highly structured transcripts might serve as miRNA precursors. The transcripts were assembled by RNA-seq reads, and the transcript IDs were provided in the figure. The mature miRNA-coding regions on the long stems of the miRNA precursors were marked by red lines, and the mature miRNA IDs were provided. Note, for each mature miRNA, its average accumulation level in either organ (flower, leaf, root or stem; two biological replicates for each organ) of *Dendrobium officinale* should be 5 RPM or higher. The secondary structures of the transcripts were predicted by using RNAfold (<http://rna.tbi.univie.ac.at/cgi-bin/RNAfold.cgi>).

Figure S3 Certain highly structured transcripts might serve as miRNA precursors. The transcripts were assembled by RNA-seq reads, and the transcript IDs were provided in the figure. The mature miRNA- and miRNA*-coding regions on the long stems of the miRNA precursors were marked by red and blue lines respectively, and their IDs were also provided. Note, for each mature miRNA, its average accumulation level in either organ (flower, leaf, root or stem; two biological replicates for each organ; thus, there are a total of eight libraries) of *Dendrobium officinale* should be 5 RPM or higher. Besides, the accumulation level of each miRNA* should be detectable in at least one sRNA-seq library. The secondary structures of the transcripts were predicted by using RNAfold (<http://rna.tbi.univie.ac.at/cgi-bin/RNAfold.cgi>).

Figure S4 Certain highly structured transcripts might serve as miRNA precursors. The transcripts were assembled by RNA-seq reads, and the transcript IDs were provided in the figure. The mature miRNA- and miRNA*-coding regions on the long stems of the miRNA precursors were marked by red and blue lines respectively, and their IDs were also provided. The 5' ends of the degradome signatures supporting the

processing of miRNAs and/or miRNA*s from their precursors are represented by green arrows. Note, for each mature miRNA, its average accumulation level in either organ (flower, leaf, root or stem; two biological replicates for each organ; thus, there are a total of eight libraries) of *Dendrobium officinale* should be 5 RPM or higher. Besides, the accumulation level of each miRNA* should be detectable in at least one sRNA-seq library. The secondary structures of the transcripts were predicted by using RNAfold (<http://rna.tbi.univie.ac.at/cgi-bin/RNAfold.cgi>).

Figure S5 T-plots providing degradome-seq data-based evidences for cleavage actions between specific miRNA--target pairs identified from *Dendrobium officinale*. Four degradome-seq libraries prepared from four organs (root, flower, stem and leaf; represented by four different signs) of *Dendrobium officinale* were included for drawing t-plots. For each miRNA--target pair, two scatter diagrams are provided. The left diagram with target ID provides a global view of degradome signals distributed all along the full-length target transcript. The right diagram with ID(s) of regulatory miRNA(s) provides a detailed view of degradome signals within about 60-nt region surrounding the predicted miRNA binding site (marked by a green horizontal line) on the target transcript. The y axis of each diagram measures the intensity (in RPM) of degradome signals. Please note: only the miRNA--target pairs supported by prominent degradome signatures resided within 10th to 11th nt from the 5' ends of the regulatory miRNAs are included in this figure.

Figure S6 Examples of miRNA--target pairs showing organ-specific regulation.

Data S1 Sequences of the transcripts highly accumulated in specific organs in Table S2.

Data S2 Sequences of the transcripts predicted to be miRNA precursors in Figure S2.

Data S3 Sequences of the transcripts predicted to be miRNA precursors in Figure S3.

Data S4 Sequences of the transcripts predicted to be miRNA precursors in Figure S4.

Data S5 List of miRNA--target pairs identified based on degradome-seq data.

Data S6 Transcript sequences for Data S5 and Table S5.

Data S1 Sequences of the transcripts highly accumulated in specific organs in Table S2.
