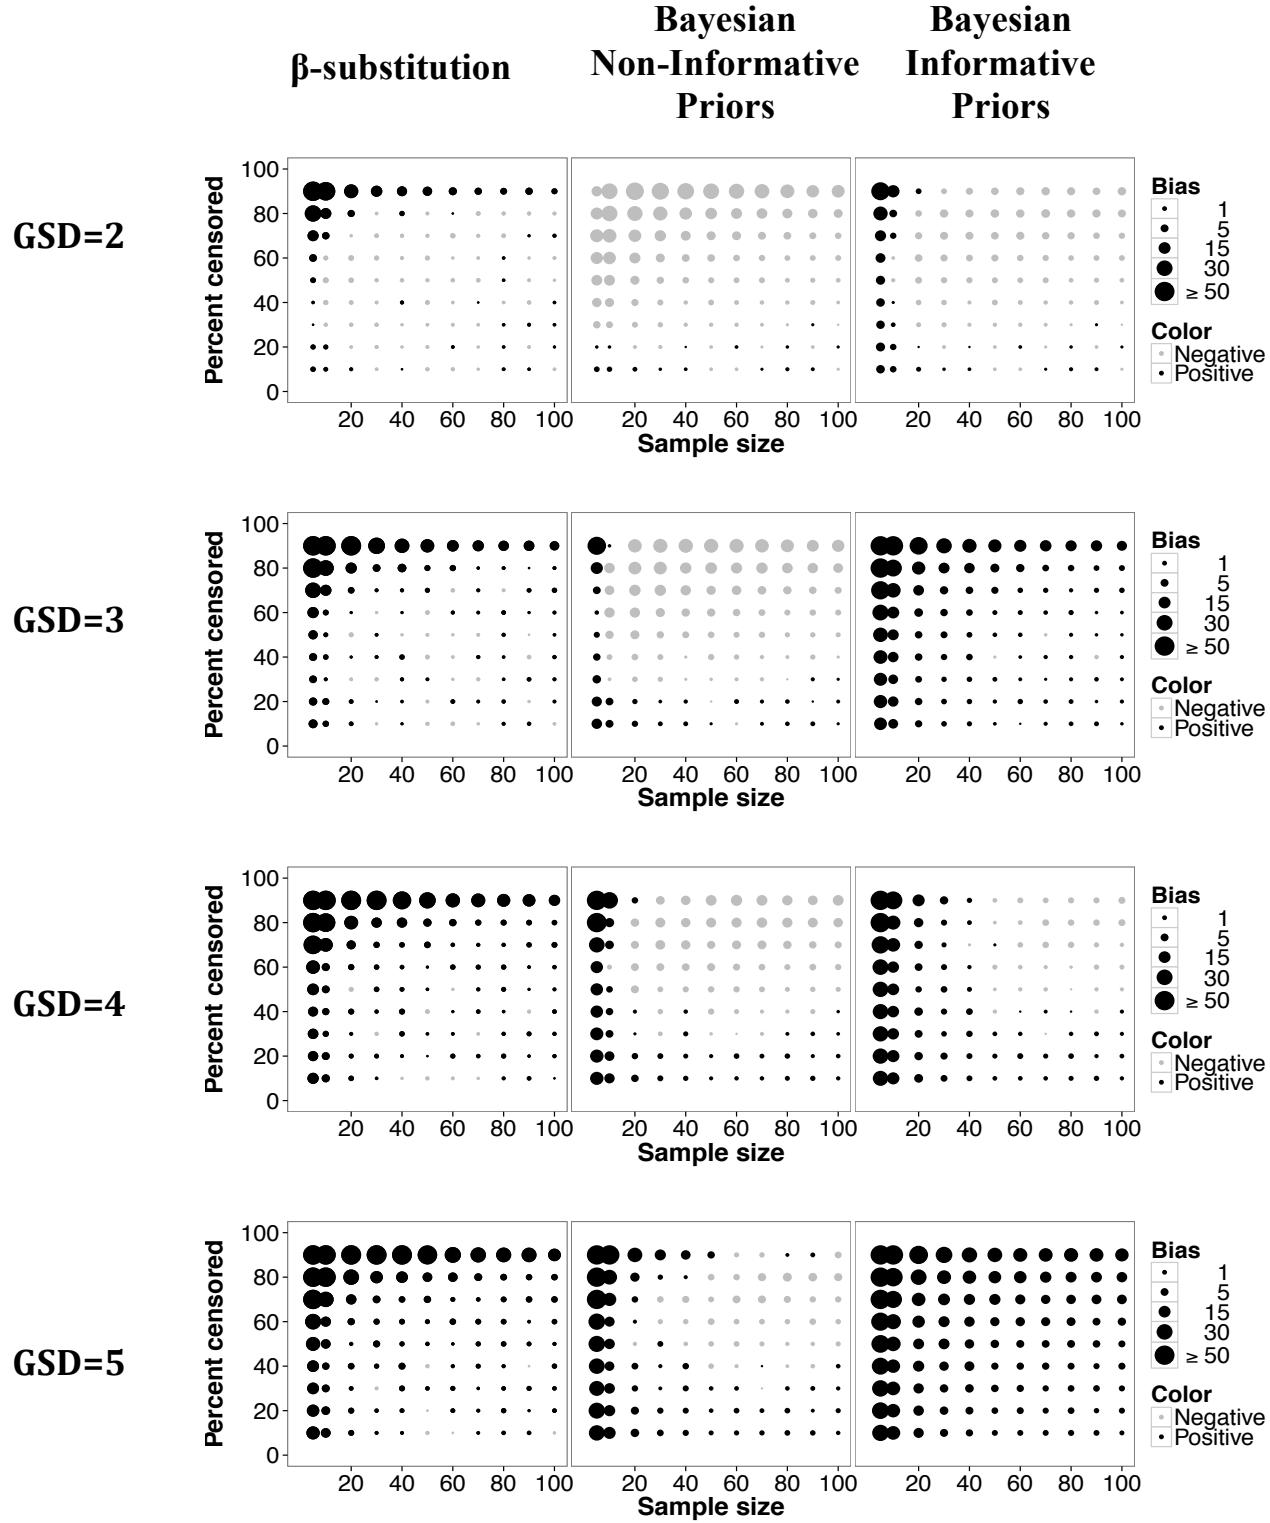

Figure 1: Relative bias in the estimate of the GM of a lognormal distribution and a single LOD for different sample sizes, percent censoring, and GSDs for the β -substitution method and the Bayesian method with non-informative priors.

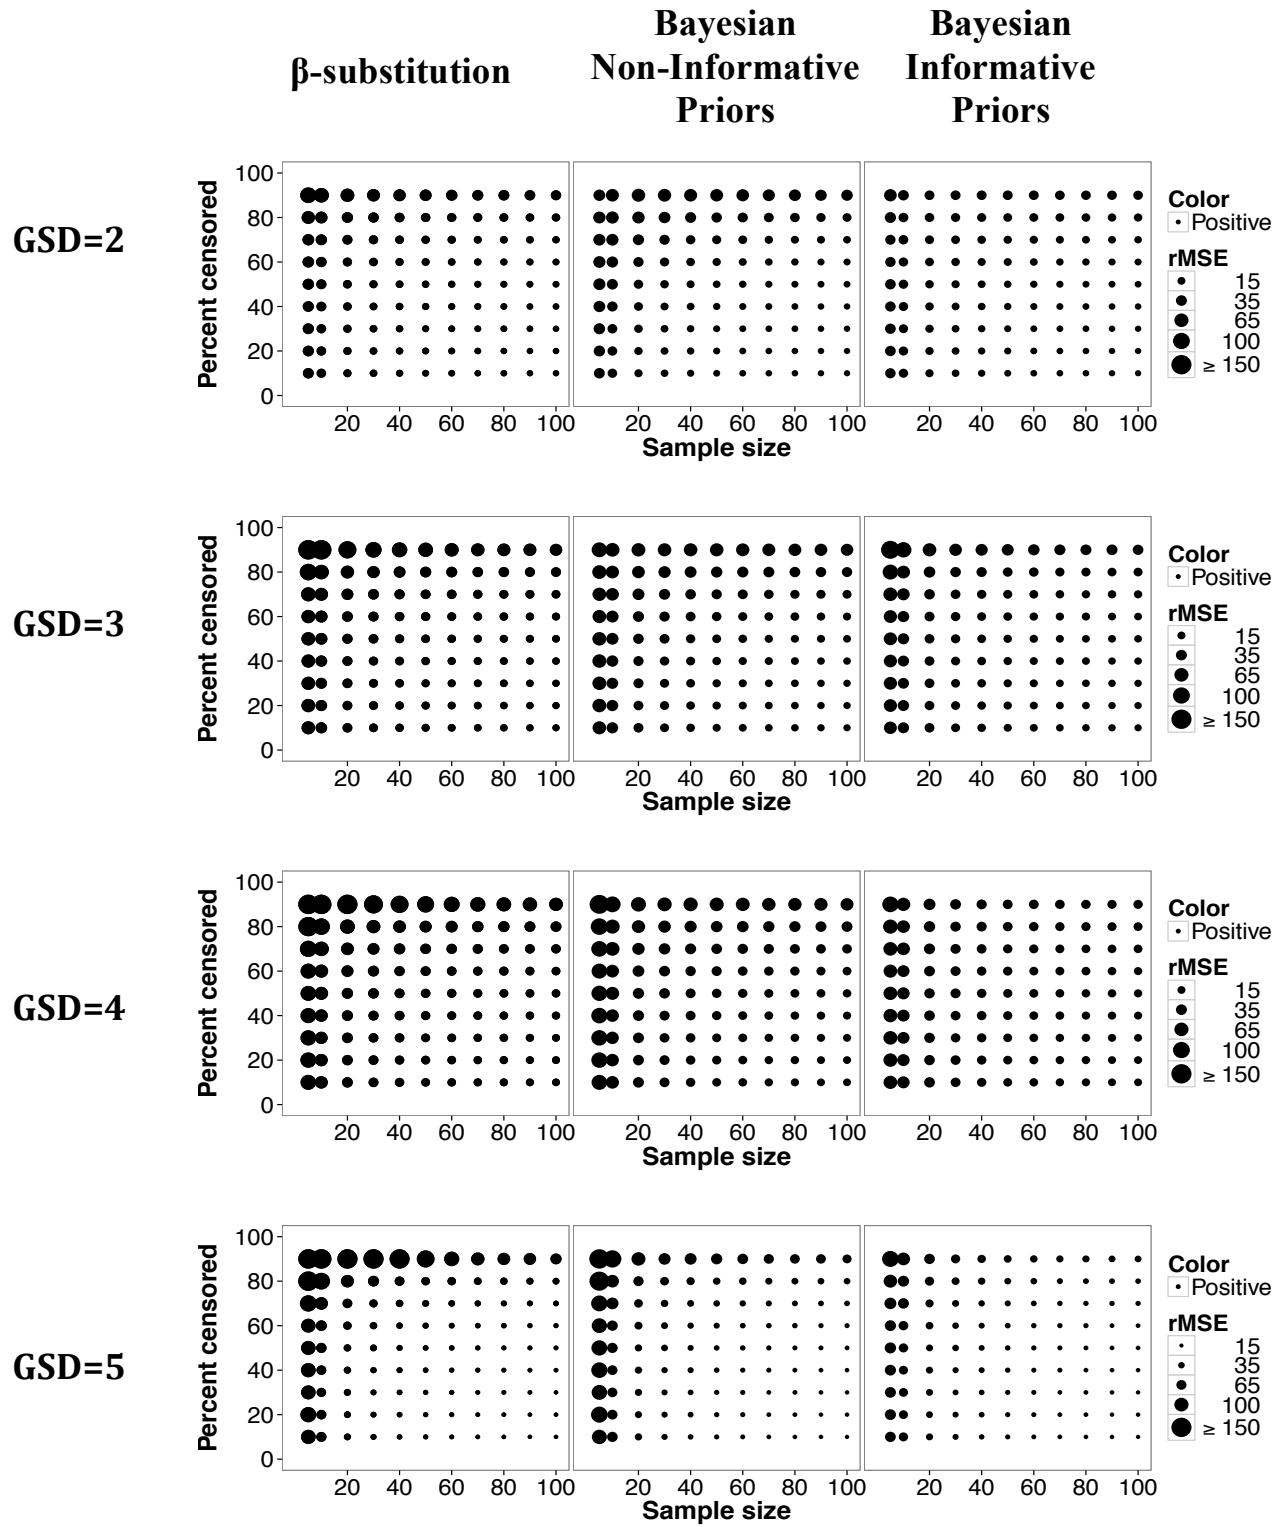

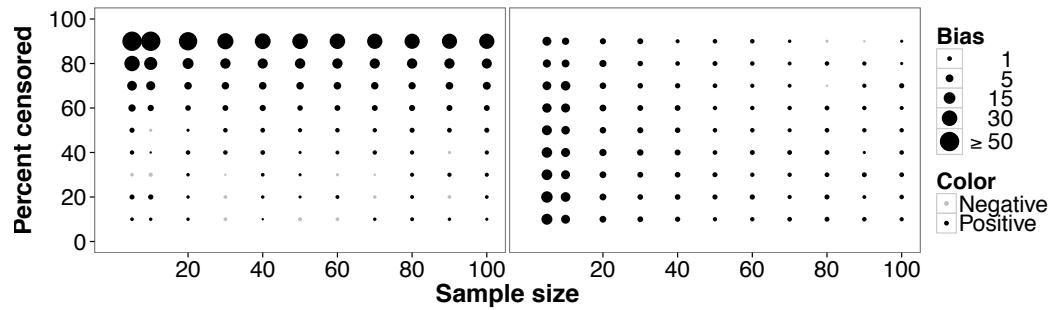

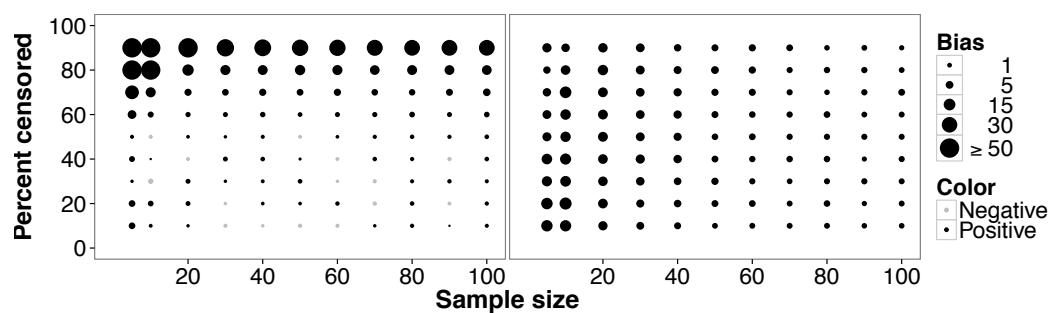

Figure 2: Relative rMSE in the estimate of the GM of a lognormal distribution and a single LOD for different sample sizes, percent censoring, and GSDs for the β -substitution method and the Bayesian method with non-informative priors.

Bayesian Non- Informative Priors

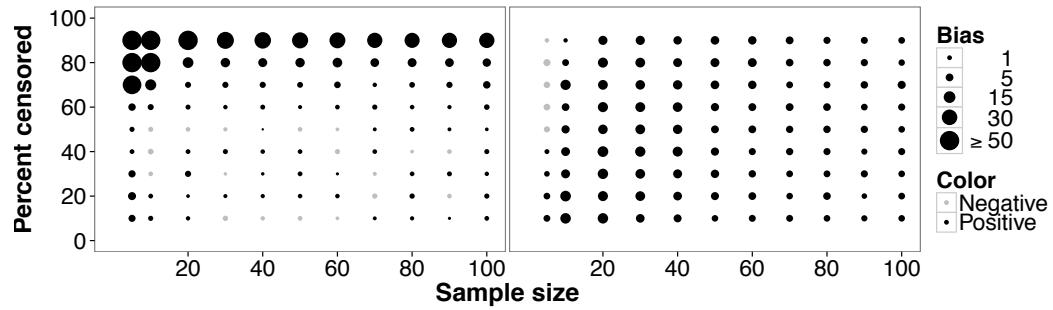

GSD=2

GSD=3

GSD=4

GSD=5

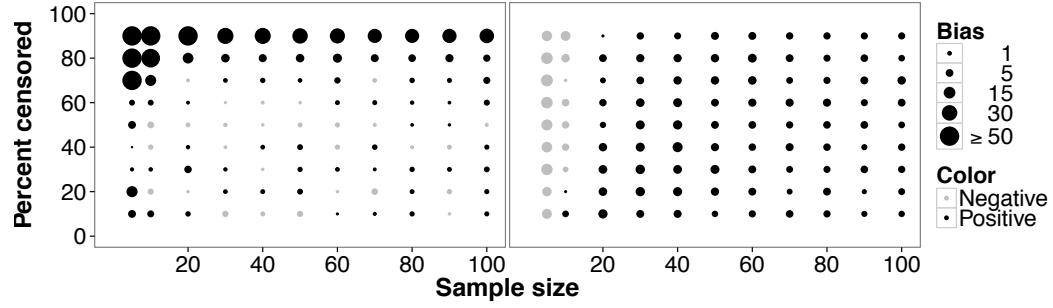

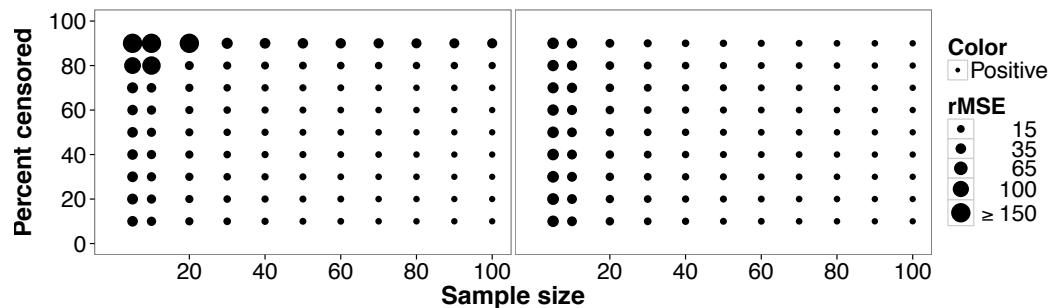

Figure 3: Relative bias in the estimate of the AM of a lognormal distribution and large gap multiple LODs for different sample sizes, percent censoring, and GSDs for the β -substitution method and the Bayesian method with non-informative priors. When p_1 is at 90%, the expected level of censoring is actually about 60% (the average for the three LODs).

GSD=5

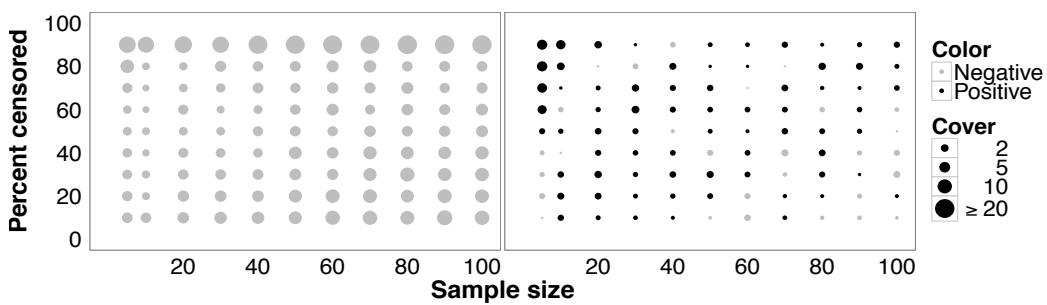

Figure 7: Coverage probabilities (in percent) for the AM of a lognormal distribution and large gap multiple LODs for the β -substitution method and the Bayesian method with non-informative priors. The size of the circle represents difference between the actual coverage probability minus the target 95%. When p_1 is at 90%, the expected level of censoring is actually about 60%.

Bayesian Non- Informative Priors

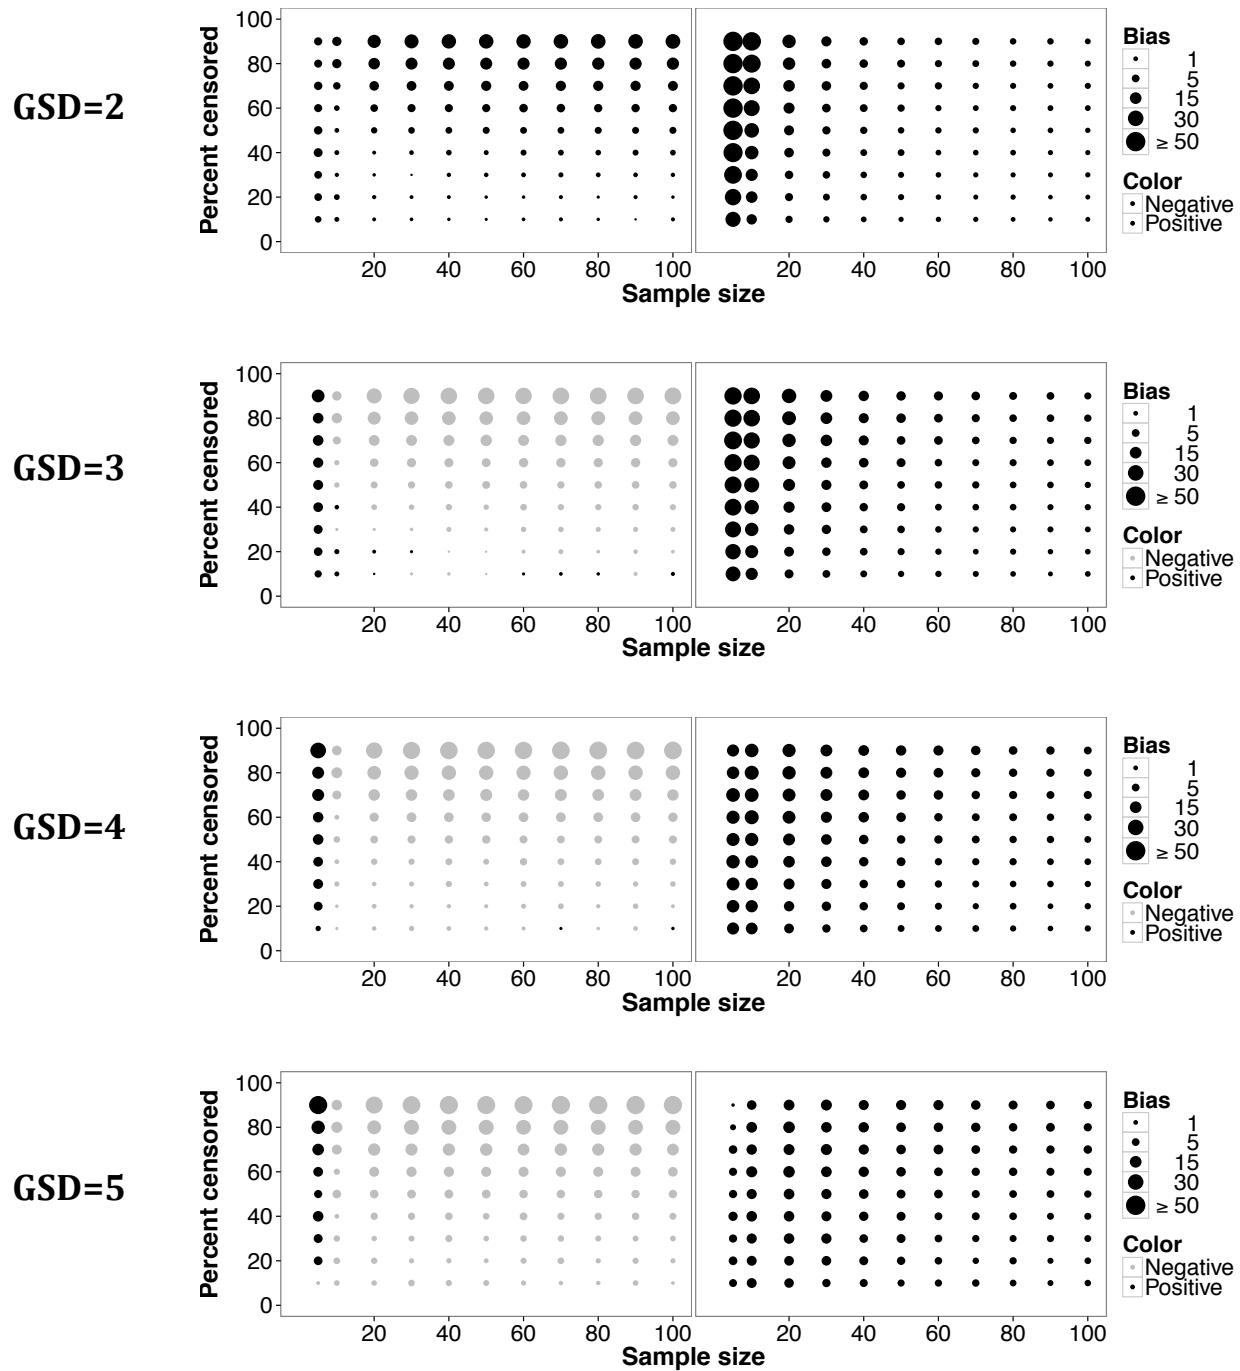

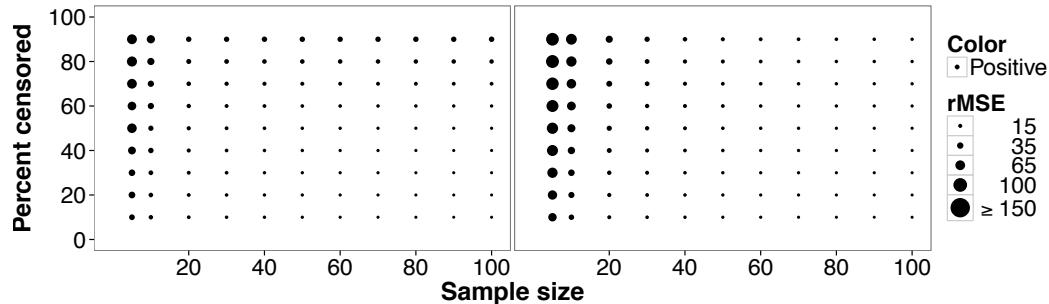

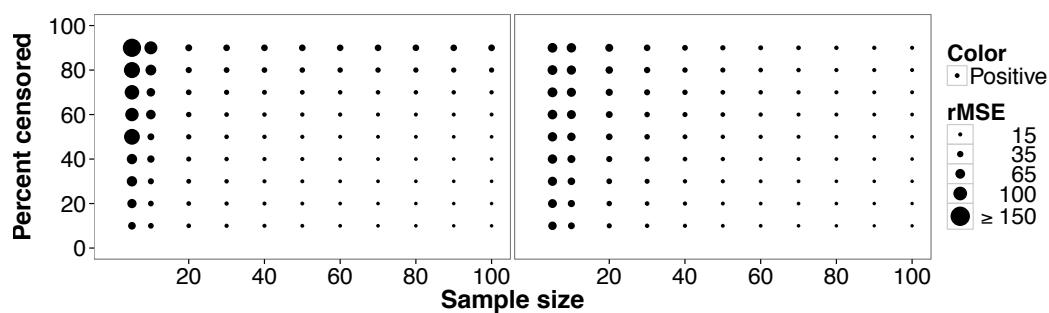

Figure 8: Relative bias in the estimate of the GSD of a lognormal distribution and large gap multiple LODs for different sample sizes, percent censoring, and GSDs for the β -substitution method and the Bayesian method with non-informative priors. When p_1 is at 90%, the expected level of censoring is actually about 60%.
