

A Comparison of 5hmC H-scores in normal tissue vs. primary tumors vs. metastatic tumors

B Comparison of 5hmC H-scores by Fuhrman grade

C Comparison of 5hmC levels by Fuhrman grade

S6 Fig. 5hmC levels in normal kidney, primary renal cell carcinoma and metastatic renal cell carcinoma. (A) Density plot shows distribution of 5hmC levels in normal tissue (red) and primary tumor (green) and metastatic (blue) samples. Note that normal tissue shows a dense peak at high H-score values, whereas both primary and metastatic renal cell carcinoma are characterized by low 5hmC levels. (B) Association of 5hmC and Fuhrman grade. Box plots show distribution of 5hmC H-scores in different Fuhrman grade groups. (C) Breakdown of 5hmC staining levels in Fuhrman groups. Note the shift in 5hmC H-score levels at the transition from grade ≤ 2 to ≥ 3 .
