

SUPPLEMENTARY FIG. S2. Confocal imaging of IFN- λ 4 orthologs. HepG2 cells were transfected with expression constructs that produce IFN- λ 4-Halo orthologs and an empty Halo-tag vector in single replicates. Representative confocal images of cells stained with fluorescent Halo ligand show predominantly cytoplasmic expression of IFN- λ 4-Halo orthologs; both cytoplasmic and nuclear expression was detected in dog and panda (and possibly in pig). Red staining—IFN- λ 4-Halo, blue—nuclei (DAPI).
