B

**Supplemental Figure 1. (A)** Representative profile of the gating strategies utilized to define the percentages of CD4<sup>+</sup> T cells expressing  $\alpha 4\beta 7$ ,  $\alpha 4$ ,  $\beta 1$ ,  $\beta 7$ , and  $\alpha E$  in cells isolated from gut biopsies **(B)** Representative profiles of the flow cytometric analysis of the pairing of  $\alpha 4$ ,  $\beta 1$ ,  $\beta 7$ ,  $\alpha E$  with  $\alpha 4\beta 7$  integrins (columns 2-5, respectively) from RM (rhesus macaques, top row), PM (pigtailed macaques, middle row) and SM (sooty mangabeys, bottom row). Column 1 shows the profile of  $\alpha 4\beta 7$  expression by CD4<sup>+</sup> T cells from cells isolated from gut tissues. Similar analysis were performed as described in Fig. 2C.

**Supplemental Figure 2.** Studies of the co-expression of  $\alpha 4\beta 1$  and  $\alpha 4\beta 7$  integrins on the gated population of  $\text{CD3}^+$ ,  $\text{CD4}^+$  T cells from rhesus macaques. The top panel shows the staining of the APC-conjugated anti- $\alpha 4\beta 7$  mAb along with PE-avidin (background control). The bottom panel shows the profile of the co-staining of the  $\text{CD3}^+$ ,  $\text{CD4}^+$  T cells using APC-conjugated anti- $\alpha 4\beta 7$  with biotinylated VCAm-1 followed by PE-avidin

**Supplemental Table 1.** GenBank accession numbers of retrieved  $\alpha 4$ ,  $\beta 7$ ,  $\alpha E$  and CCR5 promoter sequences used in the phylogenetic analyses of the study
