

Fig. S1. Binding of BPA to human prostate LNCaP cancer cells

BPA-FITC or BSA-FITC was added to LNCaP cells in the absence or presence of 200 mM galactose on a slide glass, and the cells were then incubated at 37°C for 1 h. The fluorescence was observed under a fluorescence microscope. The green image shows the distribution of the lectin; and blue images show the nuclei stained by DAPI. Scale bars: 100 μ m.
