Supplementary Figure 1

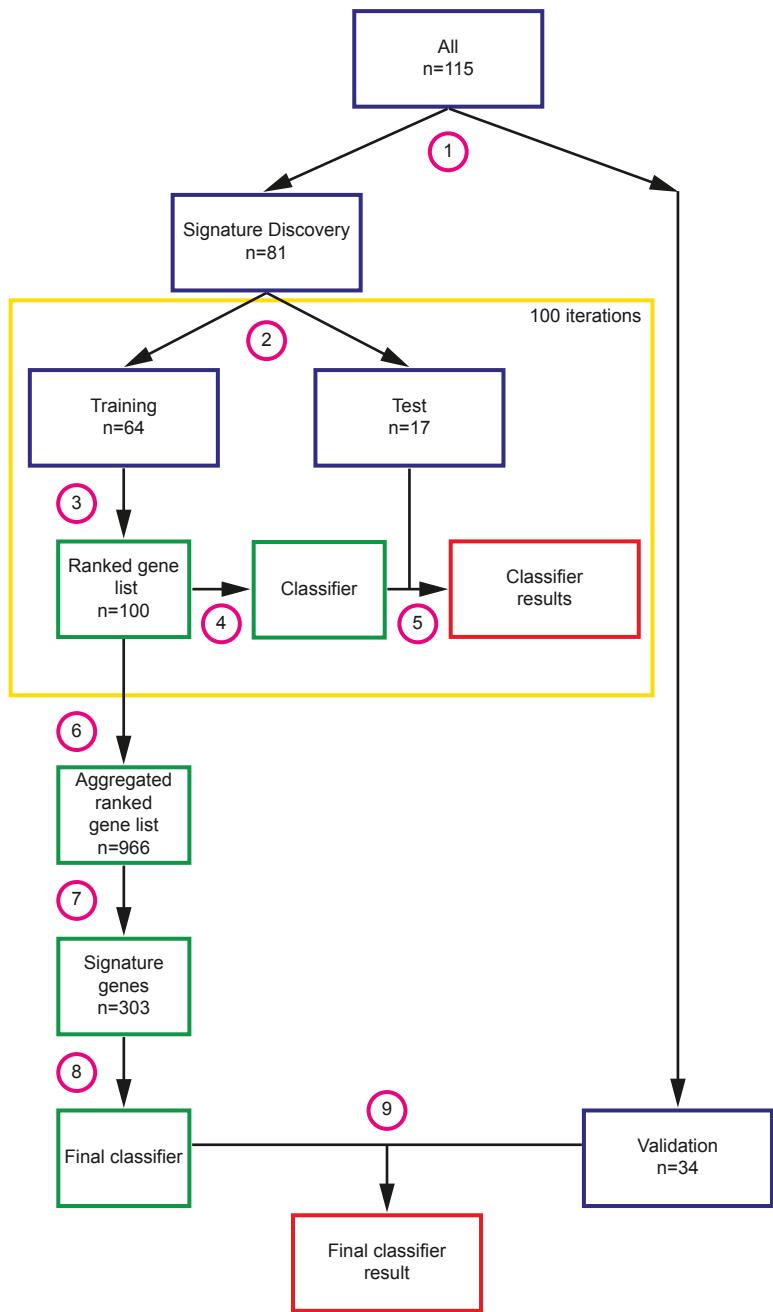

Supplementary Figure 1. Correction of biopsy timing and batch effect. A shows PCA plots for the uncorrected profiles of all samples ($n=115$) with batches (left) and biopsy timing (middle) superimposed. The right plot shows the amount of variation in the data explained by each of the first ten principal components. B shows the same plots but after correcting for the biopsy timing effect. C shows the results after also correcting for the batch effect.

Supplementary Figure 2

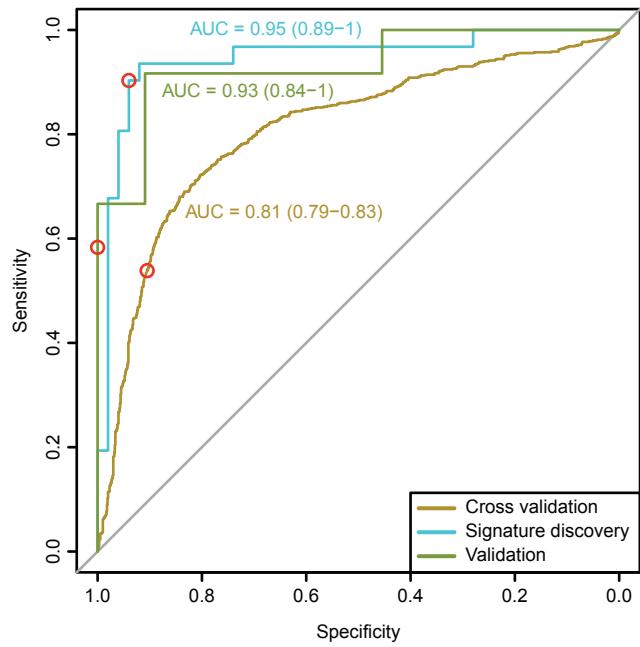

Supplementary Figure 2. PCA plots with patient characteristics and treatment variables. This figure shows PCA plots with 8 different patient characteristics and treatment variables superimposed. Continuous variables were dichotomized into below and above/equal to median value. The lower right plot shows the amount of variation in the data that is explained by each of the first ten principal components.

Supplementary Figure 3

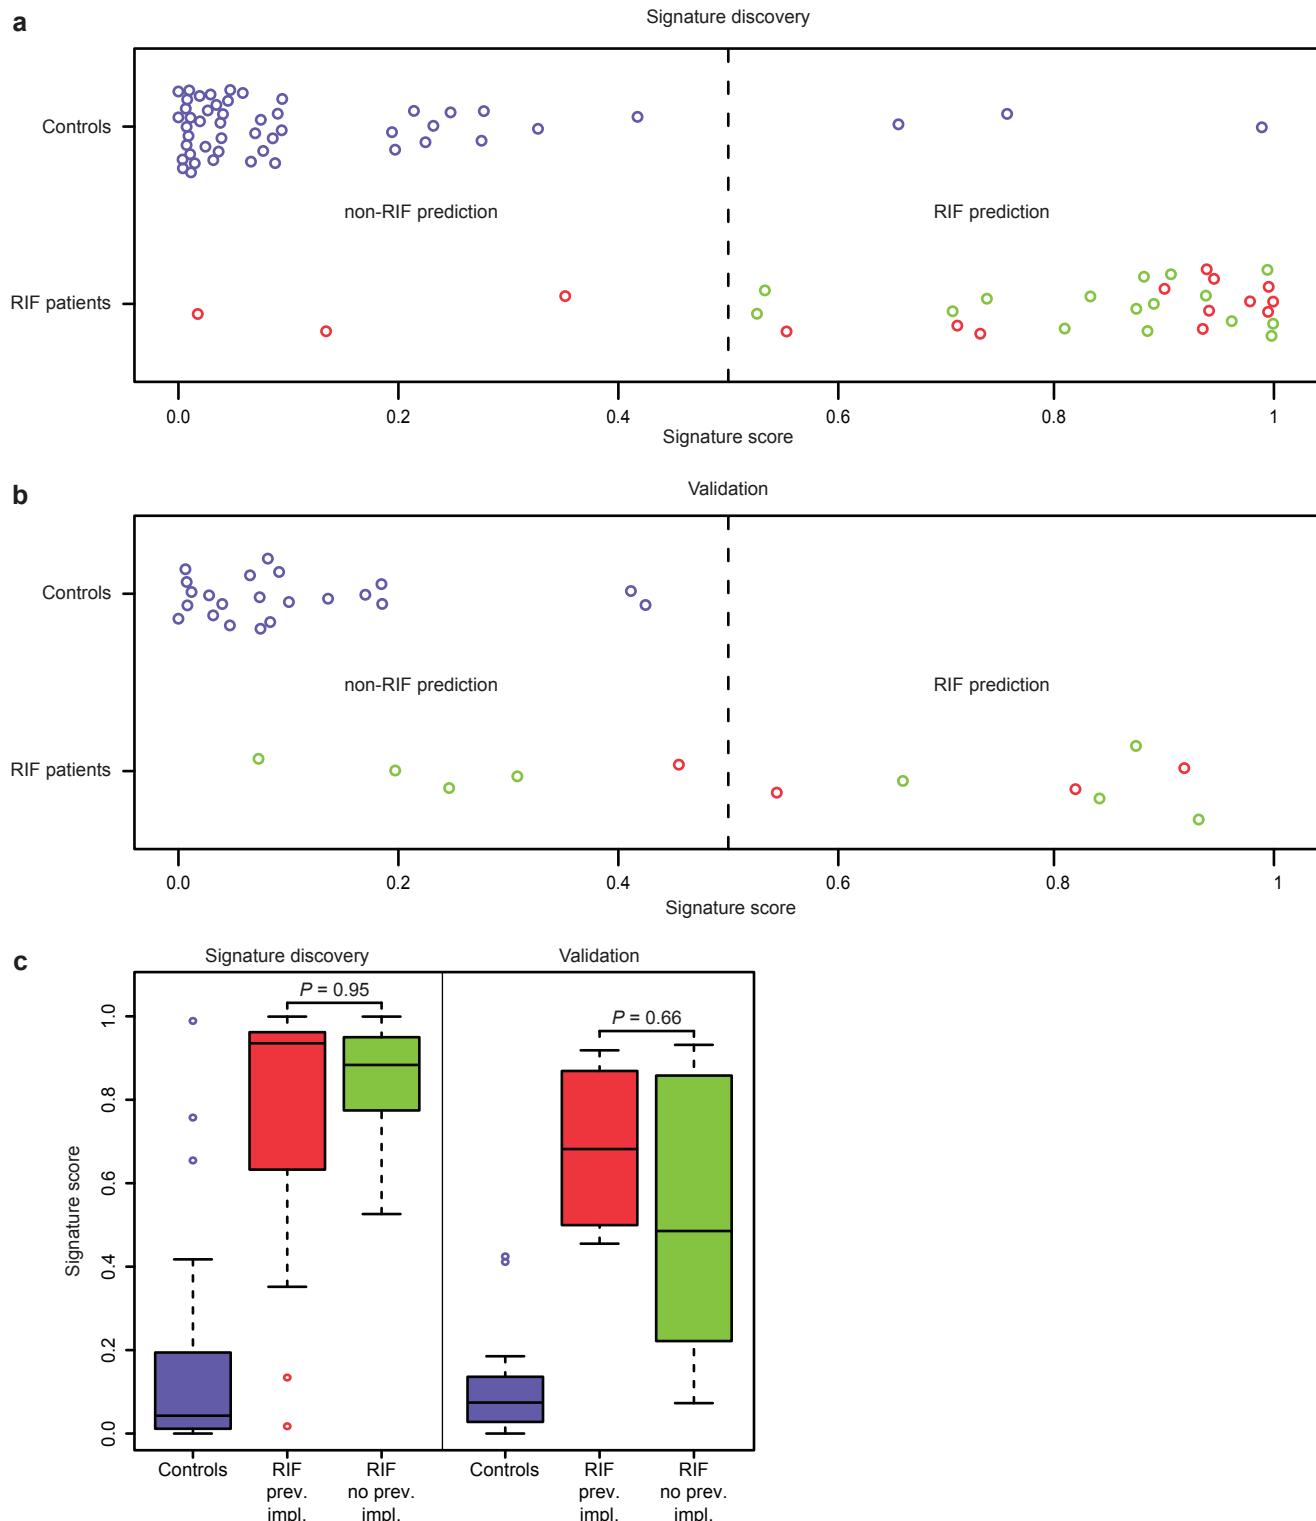

Supplementary Figure 3. Signature discovery algorithm. Diagram depicting the data used (blue boxes), analyses performed (numbered circles), output generated (green boxes) and performance measured (red boxes) during signature discovery and validation. In the first step the data is split between a signature discovery set and a validation set, step 2 involves splitting the signature discovery set into a training and test set. The training data is used to identify the 100 genes that best distinguish between RIF patient and controls (step 3). These 100 genes are employed to build a SVM classifier (step 4) which then attempts to predict the class of the samples in the test set (step 5). Step 2 to 5 are repeated 100 times which results in 100 separate 100-gene lists. These 100 lists are combined in a single list which is ranked by the occurrence of individual genes in the 100 lists (step 6). All genes which occur 10 times or more are included in the final signature (step 7) which is used to build a SVM classifier (step 8). The ninth and last step is to use the final classifier to classify the samples in the validation set.

Supplementary Figure 4

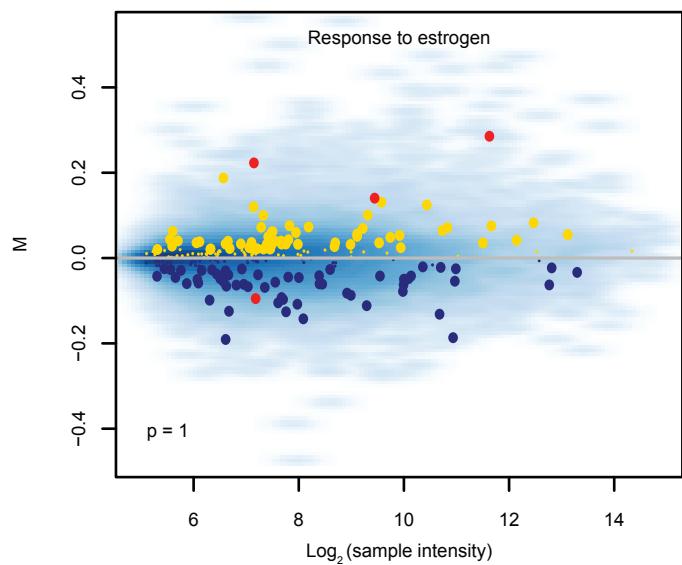

Supplementary Figure 4. Classifier ROC curves. This figure shows ROC curves for classifier performance. It is similar to Fig. 1C (blue and green curves) with an extra curve added (yellow) for the results of the 100 iterations of the cross validation procedure during signature discovery (step 5 in Supplementary Fig. S3). The Area Under the Curve (AUC) with the 95% CI is shown next to the curves. The dots indicate the point of the ROC curve that corresponds with the actual threshold used for classification (0.5).

Supplementary Figure 5

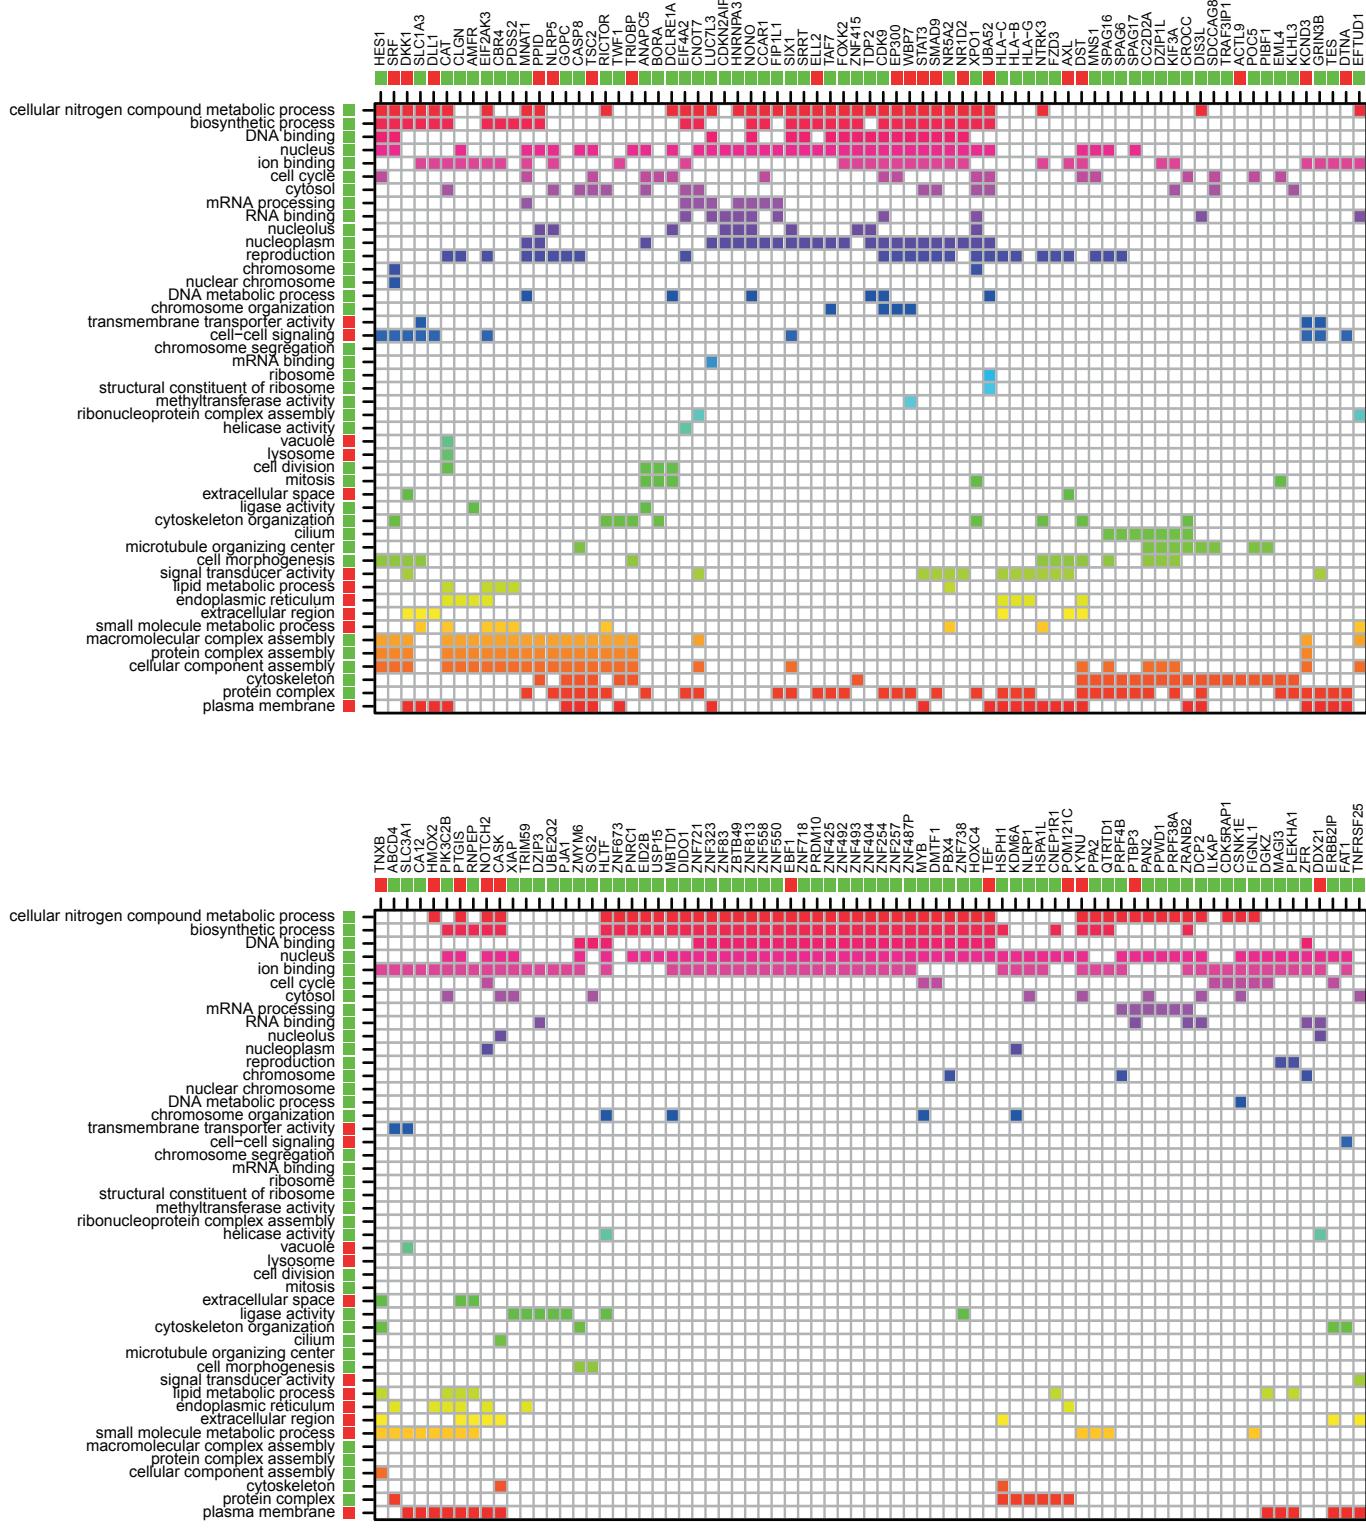

Supplementary Figure 5. Impact of previous implantation events on classifier outcome. This figure is similar to Figs. 1A and B, additionally dividing RIF patients into those with an implantation event prior to the endometrial biopsy and those without. A shows the signature scores for all RIF patients with previous implantation (red) and without previous implantation (green) and controls (blue). The signature scores are based on a classifier trained on all samples in the signature discovery set with the exception of the sample that is predicted (leave one out cross validation). All samples with a signature score below 0.5 are predicted to be controls, those with a signature score of 0.5 or higher are predicted to be RIF patients (the threshold is shown as a dotted line). B is similar to A. The samples shown are from the validation set which were scored based on a classifier trained on all samples in the signature discovery set. C shows boxplots of the signature scores of three groups; controls (blue), RIF patients with (red) and without previous implantation (green). P was calculated with a two-sided Mann-Whitney test.

Supplementary Figure 6

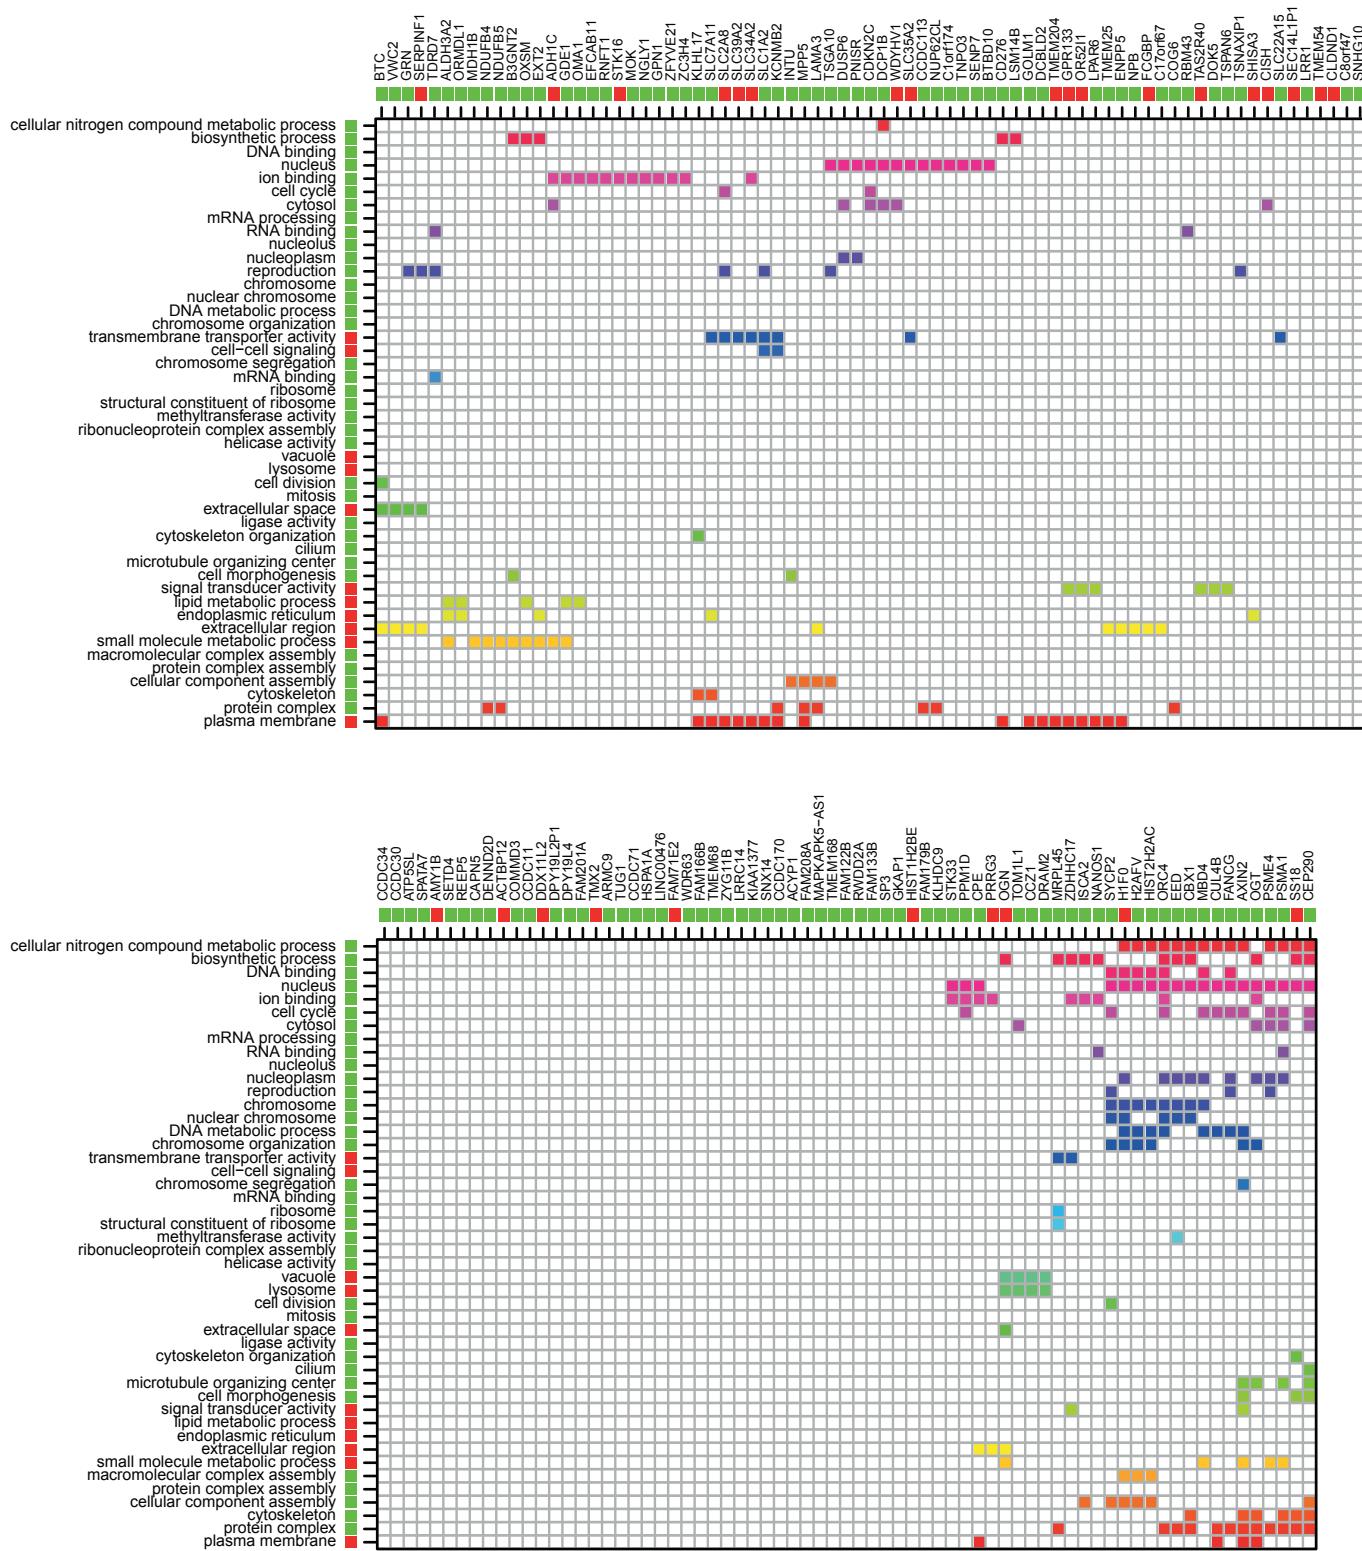

Supplementary Figure 6. Estrogen response enrichment analysis. This figure shows the gene expression of RIF patients compared against controls (log2 fold change or M) and the average expression across all samples (log2 sample intensity). Genes in the GO term 'response to estrogen' (GO:0043627) which are up-regulated in RIF patients are shown in yellow, genes down-regulated in blue. Shown in red are the genes which are also part of the 303-gene signature. Genes that are not part of the GO term are shown as a blue density map where darker blue indicates higher gene density.

Supplementary Figure 7

Supplementary Figure 7. Functional characterisation 303-gene signature. This figure is similar to Fig. 2E but now showing all signature genes ($n=296$) present in the GO database.
