SUPPLEMENTARY METHODS

Immunofluorescence (IF) Analysis

Cells (5×10^3 cells per well) were seeded into 6-well plate. The next day, cells were rinsed with ice-cold PBS and fixed with 5% paraformaldehyde for 10 min at RT. Then, cells were treated with 1% BSA (in PBS) plus 0.2% Triton X-100 for 15 min. Cells were subjected to immunofluorescence staining with indicated antibodies (1:200) for 1 h at RT. Cells were then washed with PBS three times for 10 min each. Cells were incubated with indicated secondary antibody (1:200) at RT for 1 h. Cells were washed with cold PBS three times for 10 min each, and incubated with DAPI (0.1 $\mu\text{g/ml}$) to stain the nucleus. The cells were examined by confocal microscopy (Olympus).
