

Supplemental Figure 2. OvCa patient survival based on CA125, anti-CA125, and anti-DISGTNTSRA status at time of diagnosis. Patients with survival data (Stage I/II $n=9$, Stage III $n=50$) were divided into groups based on CA125 (normal < 35 IU/mL, elevated >35 IU/mL), anti-CA125 (median cutoff), and anti-DISGTNTSRA (median cutoff). Kaplan-Meier survival curves were generated using all patients or Stage III patients only. P -values are reported for Log-rank test and median survival times are indicated.
