

Supplementary S6: Detailed results on insect community measures

Effect of sampling solution on species richness

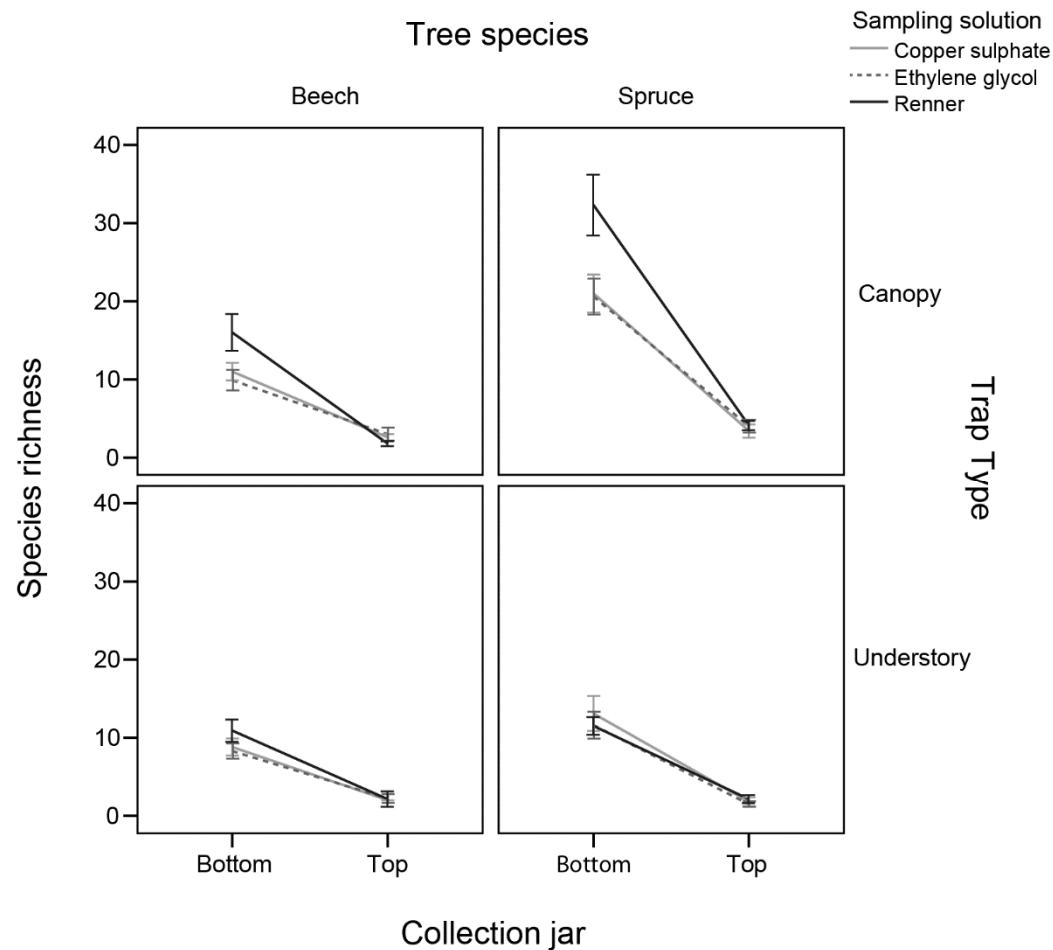

Figure A: The species richness of Coleoptera samples collected, across all treatments. A significant 3-way interaction ($P=0.05$) was found between tree species, sampling solution and jar for the species richness but not the diversity of Coleoptera. Error bars represent $\pm 1SE$.

Table A: Species positions along the first and second RLQ axis (sorted by RLQ1) referring to Figs 2 and 3 of the main manuscript. Additionally mean body size as well as feeding and habitat traits of species are given.

Order	Suborder	Family	SpeciesID	RLQ1	RLQ2	BodySize	Feeding	Habitat

Feeding guilds: c = carnivore, d = decomposer (excl. wood), dx = decomposer-wood, h = herbivore (excl. xylophage), m = mycetophagous-fungi, mm = mycetophagous-mold

Habitat guilds: df = fresh dead wood, do = old dead wood, ds = specific dead wood structures at living trees, e = eurytop, g = ground dweller, rnf = rotten substrate/nests/fungi (excl. wood), v = vegetation, wf = wood fungi.

Table A: Multivariate fourth corner analyses [1] on the effects of Sampling solution, stratum, and forest type on species traits. We used the sequential test [2] as recommended in Dray et al. [3], using Holm correction of p-values (999 permutations). Significant value is marked in bold.

	Statistic	Sampling Solution	Stratum	Forest type
Mean body size	F	30.316	45.452	144.514
Feeding guild	Chi ²	646.494	216.936	233.906
Habitat preference	Chi ²	1151.755**	267.656	116.681
