

Supplementary Figure S1. Estimation of genetic structure within the Catalonian *A. thaliana* population using STRUCTURE and InStruct. Each vertical bar represents an individual plant genotyped at 425 genome-wide SNP markers, and each bar is divided into K coloured sections that indicate the fractional membership of an individual in K clusters based on its genotype. The figure of each K is based on the analysis with highest probability for that value of K . Vertical white line divides demes of coastal and inland origins. See Table S2 for details of which demes were genotypes.

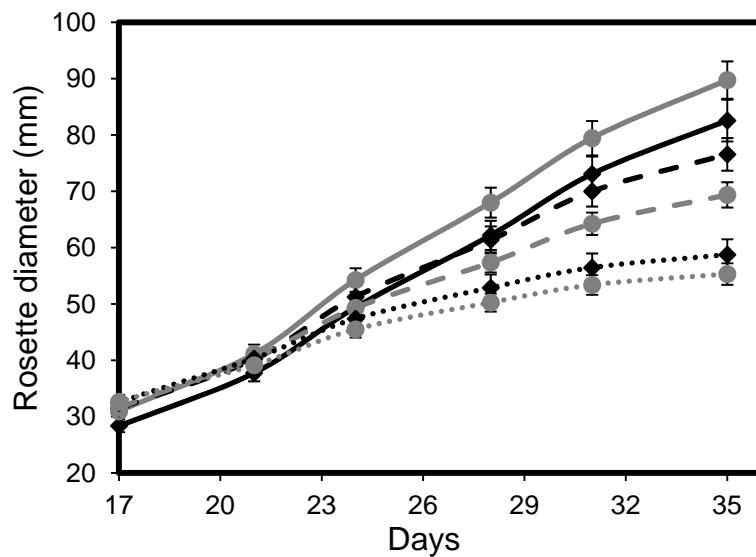

Supplemental Figure S2. Clustering of individual plants from coastal and inland demes by genotype. **(A)** Cladogram of 98 plants from 17 coastal (40 plants, red rhombus) and 13 inland (58 plants, blue circles) demes using 425 SNP markers aligned in ClustalX2 and performed using MEGA 6.0. **(B)** Map of north-eastern Catalonia, Spain with the location of *A. thaliana* demes used for the genetic clustering, reference: <https://www.google.com/maps/d/edit?mid=zK9pJcdixO40.kQSYnAmGzdr0> for Google map. Pictures of representative *A. thaliana* growing in inland (**C**) and coastal habitats (**D**).

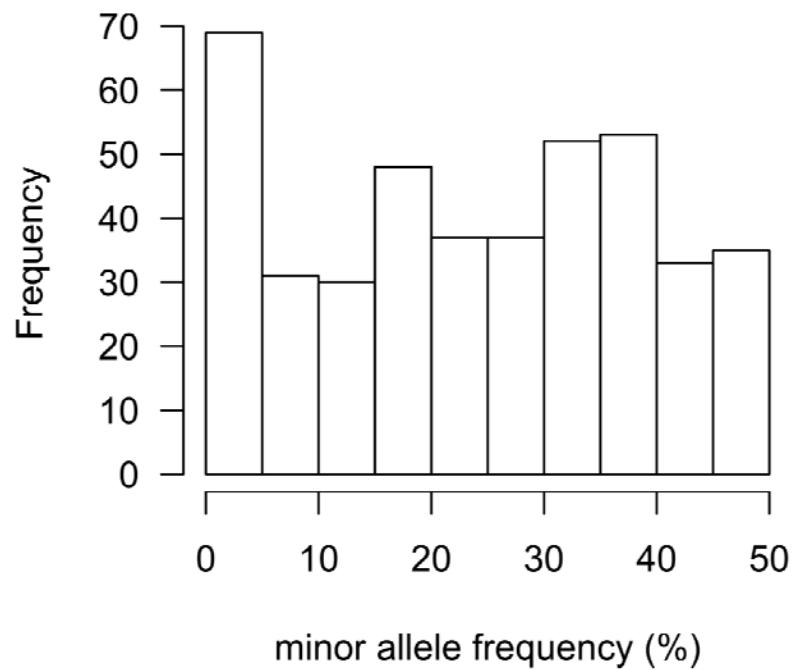

Supplemental Figure S3. Pictures of common garden plots used in the reciprocal transplant experiments in Marimurtra Botanical Garden, Blanes (**A – D**) and the School of Forestry and Agricultural Training at Santa Coloma de Farners (**E – H**). Picture illustrate the frame and cloth used to shade the plots and plants growing in grids within the plots.

continued

Supplemental Figure S4. Effects of NaCl treatments on growth of *A. thaliana* plants from coastal and inland demes. Growth of plants was measured as rosette diameter in plants from coastal (black diamonds) and inland (grey circles) demes after exposed to either 0 mM (solid lines), 50 mM (dashed lines) or 100 mM (dotted lines) NaCl in the hydroponic growth solution. Data represents the mean \pm SE ($n = 6$ plants per deme and 13 demes from coastal and inland habitats, see Table S2 for details). Leaf tissue from these plants was used to measure leaf concentration of Na⁺ and K⁺ shown in Fig. 6, C to E.

Supplemental Figure S5. Distribution of the minor allele frequency of 425 genome-wide single nucleotide polymorphism (SNP) markers across 98 *A. thaliana* individuals.

Supplemental Table 1. Summary of 20 ecological variables tested to perform the distribution map of *A. thaliana* in NE of Catalonia. Factors in bold had a significant influence.

Variable	Source	Scale/Grid resolution	% of selected classes (*)
Altimetry (hypometry, m)	Gencat (ICC)	DMA (5 x 5 m)	< 50 %
Soil covers 2007(MCSC-3v2)	Gencat (CREAF)	2 x 2 m	> 50 %
Land uses 2002(LANDSAT-TM)	Gencat	30 x 30 m	< 50 %
Geological base 2006	Gencat (ICC)	1 : 50.000	< 50 %
Habitats of Catalonia 2005	Gencat (ICC, UB)	1 : 50.000	> 50 %
Annual temperature range (°C)	Gencat (ACDC)	1 x 1 km	> 50 %
Potential Evapotranspiration	Gencat (ACDC)	1 x 1 km	> 50 %
Climatic water deficit (CWD)	Gencat (ACDC)	1 x 1 km	> 50 %
Daily global radiation, mean annual	Gencat (ACDC)	1 x 1 km	> 50 %
Average annual precipitation (mm)	Gencat (ACDC)	1 x 1 km	> 50 %
Average monthly precipitation (mm)	Gencat (ACDC)	1 x 1 km	> 50 %
Seasonal precipitation (mm)	Gencat (ACDC)	1 x 1 km	> 50 %
Average annual temperature (°C)	Gencat (ACDC)	1 x 1 km	> 50 %
Average monthly temperature (°C)	Gencat (ACDC)	1 x 1 km	> 50 %
Mean diurnal range	WorldClim	30 asec (1 km)	> 50 %
Isothermality	WorldClim	30 asec (1 km)	> 50 %
Maximum temperature of warmest month (°C)	WorldClim	30 asec (1 km)	> 50 %
Minimum temperature of coldest month (°C)	WorldClim	30 asec (1 km)	> 50 %
Precipitation of wettest month (mm)	WorldClim	30 asec (1 km)	> 50 %
Precipitation of driest month (mm)	WorldClim	30 asec (1 km)	> 50 %

1

2 (*) Percentage of classes for a given ecological variable across known locations of *A. thaliana*.

1 Table S3: The mean logarithmic likelihood of 10 runs at each K and the
2 corresponding ΔK statistic (peak value in bold).

3

K	LnP(K)	ΔK
1	-34817.11	-
2	-33102.57	2.78

Supplemental Table 5. Model specification including the fixed and random effects, error structure and inclusion of a variance covariate for each response variable analysed during the study. A ‘/’ denotes a nested random effect structure and ‘individual’ represents an observation level random effect.

response variable	fixed effects	random intercept	random slope	variance covariate	error structure
Field based reciprocal transplant experiments					
<i>Home vs away, local vs foreign</i>					
number of siliques	transplant habitat x native habitat	native hab/deme individual	-	-	Poisson log-normal
<i>sympatric vs allopatric</i>					
number of siliques	native habitat + deme + sympatric	native hab/deme individual	-	-	Poisson log-normal
<i>plant growth</i>					
rosette diameter	days ² x native habitat x transplant habitat	Deme/plant	day ²	$\sigma^2 \cdot e^{2\delta \cdot day^2}$	Gaussian
Controlled environment common garden experiments					
<i>Home vs away, local vs foreign</i>					
number of siliques	transplant habitat x native habitat	native hab/deme individual	-	-	Poisson log-normal
<i>sympatric vs allopatric</i>					
number of siliques	native habitat + deme + sympatric	native hab/deme individual	-	-	Poisson log-normal
<i>plant growth</i>					
rosette diameter	days ² x native habitat x transplant habitat	deme/plant	day ²	$\sigma^2 \cdot e^{2\delta \cdot day^2}$	Gaussian
Salinity tolerance assays					
<i>Plants grown in soil</i>					
number of siliques	native habitat x NaCl treatment	native hab/deme	-	-	Poisson
rosette diameter	days ² x native habitat x NaCl treatment	deme/plant	day ²	$\sigma^2 \cdot e^{2\delta \cdot day^2}$	Gaussian
<i>Plants grown hydroponically</i>					
rosette diameter	days ² x native habitat x NaCl treatment	deme/plant	day ²	$\sigma^2 \cdot e^{2\delta \cdot day^2}$	Gaussian
Na ⁺	native habitat x NaCl treatment	native hab/deme	-	$\sigma_{NaCl,habitat}^2$	Gaussian
K ⁺	native habitat x NaCl treatment	native hab/deme	-	-	Gaussian
NA ⁺ /K ⁺	native habitat x NaCl treatment	native hab/deme	-	$\sigma_{NaCl,habitat}^2$	Gaussian
