Online Supplementary Materials

Supplementary Figure S1. Network with all names of gene sets and upstream regulators for liver transcriptome of the rats fed soy and meat proteins compared to the rats fed casein.

This network was produced by using Cytoscape v3.2 and Enrichment Map plugin v2.1. Nodes represent enriched gene sets in gene set enrichment analysis of liver transcriptome in rat. The node size is proportional to the total number of genes within each gene set (from 15 to 500). The border area of the node represents the comparison of soy protein group to the casein group (Soy vs. Casein), whereas the inner area of the node represents the comparison of meat protein group to the casein group (Meat vs. Casein). The colors of nodes indicate the directions of changes of gene sets with red for up-regulation and blue for down-regulation. The enrichment P value is mapped to the node color as a color gradient. The color changes from light to bright with the P value decreasing from 0.05 to 0. The weighted grey lines between the round nodes represent the “overlap” score (Jaccard and overlap coefficients >0.375) depending on the number of genes two gene-sets share. The more genes two gene-sets share, the wider the line. The yellow triangles in the map represent the upstream regulators predicted by using Ingenuity Pathway Analysis, and they were overlapped with putative target genes in the genes sets using the Post Analysis tool in the Enrichment Map v2.1 plugin. Pink lines between round nodes and yellow triangles represent the overlap P value (Fisher’s Exact Test nominal $P<0.05$) between the enriched gene sets and the upstream regulators. Nodes of high similarity were automatically arranged close together, and circles were semi-automatically annotated and manually labelled.

Online Supplementary Materials

Supplementary Table S1. All significantly regulated genes ($P <0.05$) observed in rats after 1 week consumption of the soy and meat protein diets compared to the casein diet.

Due to the length of Supplemental Table S1, it is available as a separate supplemental Excel file.

Supplementary Table S2. All significantly gene sets ($P <0.05$ & FDR <0.25) obtained from the GSEA analysis of the liver transcriptomic data observed in rats after 1 week consumption of the soy and meat protein diets compared to the casein diet.

Due to the length of Supplemental Table S2, it is available as a separate supplemental Excel file.

Online Supplementary Materials

Supplementary Table S3. The mRNA expression of PPAR target genes in rat livers after 1 week consumption of the soy and meat protein diets compared to the casein diet.

Supplementary Table S6. Amino acid ratios¹ of soy and meat proteins using casein+1.5%Cys (AIN93G) as the reference protein

%	Soy	Meat ²	Pork	Beef	Chicken	Fish
Met	52	111	111	107	110	115
Val	54	54	56	55	51	54
Ile	81	89	90	91	90	85
Leu	81	90	91	92	88	90
BCAA ³	73	79	80	81	78	78
Lys	77	118	114	118	117	123
His	89	115	141	115	112	93
Thr	90	116	118	119	113	113
Phe	94	78	78	78	76	80
Arg	195	173	175	179	174	165

Amino acid ratios¹ (%) = (mg of an essential amino acid in 1.0 g of test protein/mg of the same amino acid in 1.0 g of (casein + 1.5% Cys)) ×100; Meat²: it was calculated by combining value of meat proteins from pork, beef, chicken and fish together. BCAA³: it was calculated by combining value of Val, Ile and Leu together.

Minerals in protein powders were detected using inductively coupled plasma optical emission spectrometer (PerkinElmer, Optima 2100 DV). Casein¹: Value for casein was obtained from company Dyets Inc. (Bethlehem, PA); nd²: not detected. Values for soy and meat proteins are shown as means ± SD. Different superscripts mean statistically significant difference at $P<0.05$ tested by one-way ANOVA and LSD multiple comparisons.
