

Figure S2

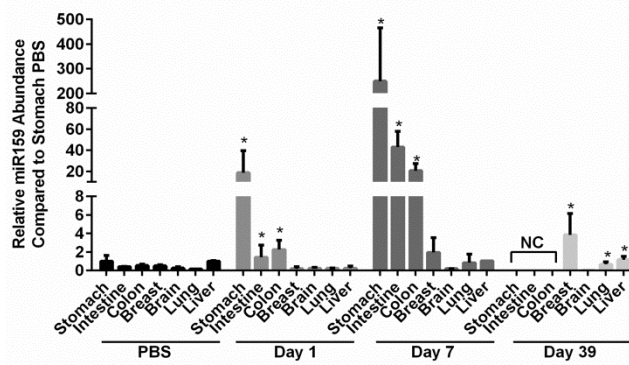

Figure S2 Distribution of miR159 after oral gavage. qPCR for miR159 in the indicated tissues from NSG mice after 1, 7, or 39 days of daily oral gavage ($n = 3, 3, 5$). Data was first normalized to the level of U6 and then plotted relative to the value of the first group (stomach PBS). $*p < 0.05$ compared to the same tissue in the control group that has received PBS. NC, not checked due to lack of tissue availability.
