--" indicates that the phytase lost all activity after pepsin treatment for 2 h.

a "fold" value was calculated as the ratio of the increased residual activity by *N*-glycosylation of phytase after pepsin treatment to the residual activity of pepsin-treated *N*-deglycosylated or nonglycosylation counterparts. The residual activity was expressed as percentage of activity of untreated enzyme. The *N*-glycosylation level of each phytase was calculated by the proportion of the *N*-glycans accounting for the molecular masses.
