

Supplementary Figure S3. γ CD Western blot of the 9 human and 2 murine tumor cell lines. An amount of 15 μ g of total protein was separated by electrophoresis on a 4–12% SDS-polyacrylamide gel at 100 V for 60 min. The resolved proteins were transferred to a nitrocellulose membrane and were probed overnight at 4°C with a mouse anti- γ CD monoclonal antibody. The next day, blots were rinsed with TBS-tween (0.05%) and probed with anti-mouse horseradish peroxidase secondary antibody for 1 hr at room temperature before chemiluminescence detection.
