Diagram showing inhibition of β -glucosidase by extracts 14 and 15 at three concentrations

β -Glucosidase was incubated with extracts at a concentration of 1, 0.1 and 0.01 mg/mL. Results are expressed as the percentage of activity of enzyme incubated with DMSO alone and are the mean \pm SE of three separate determinations. 1 μ M Isofagomine was used as specific inhibitor of β -glucosidase.
