

Supplementary Fig S2. Viral titer in MCMV-infected mice. The amount of infectious virus present in spleen of MCMV-infected WT and IDO1-KO mice was determined by a plaque detection assay using a tenfold titration of the supernatant of disrupted organ samples on the C127I mouse mammary gland epithelial cell line (CRL-1616, ATCC). Viral titers are depicted as number of plaque forming units (PFU) per spleen weight.
