Supplementary material: flanker observation pattern in the AI separately for gender

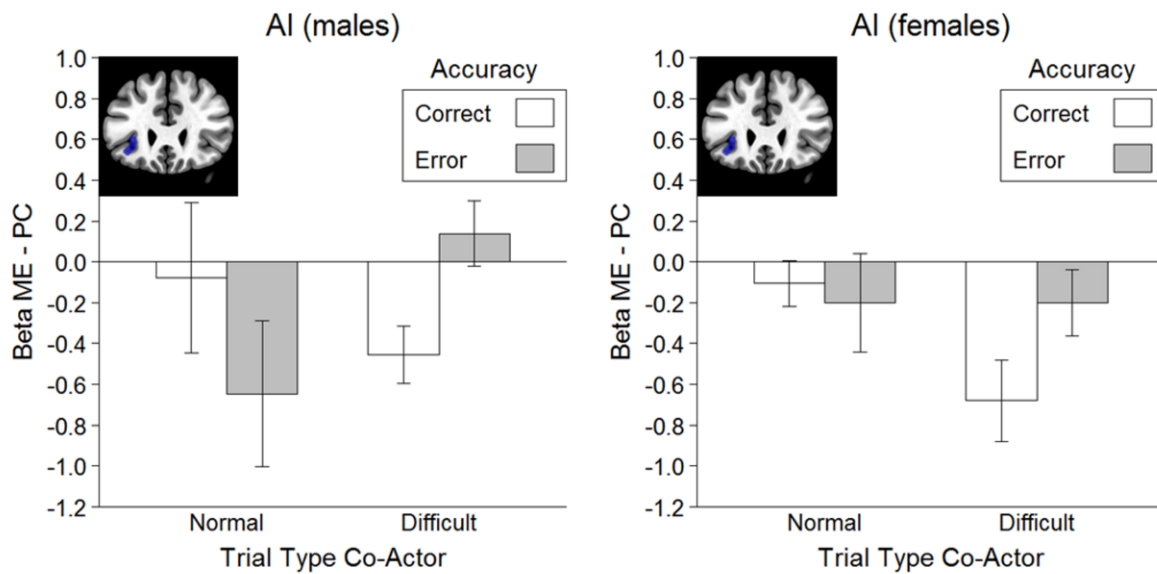

Fig S2. Results of the flanker observation task analysis for the AI ROI separately for males (N = 5) and females (N = 14). Each bar represents the difference score between the ME and the PC block (ME − PC) to control for the confounding influence of error likelihood. Error bars represent standard errors of the mean corrected for within subject designs according to Morey (2008).
