

**SI 1.** Estimates of genetic diversity for the Tasmanian devil based on 1482 SNPs. The statistics correspond to: number of individuals genotyped ( $N$ ), mean number of alleles per SNP ( $A$ ), number of private alleles ( $A_p$ ), observed heterozygosity ( $H_O$ ), and expected heterozygosity ( $H_E$ ). Presence and absence of devil facial tumor disease (DFTD) is indicated with plus and minus symbols, respectively.
