

Figure S5. Effects of Mex3B-RNAi on poly(I:C)-induced activation IRF3 and phosphorylation of TBK1 and IκBα.

The 293-TLR3 cells (2×10^5) were transfected with a control or Mex3B-RNAi plasmid (1 μg). Twenty hours after transfection, cells were left untreated or treated with poly(I:C) for the indicated times. Cell lysates were separated by native- or SDS-PAGE and analyzed with the indicated antibodies.
