1 Conversion of Semiempirical Heats of Formation to Relative ZPVE-Exclusive Energies

MNDO-based and OMx semiempirical quantum chemistry (SQC) methods are parametrized to reproduce experimental heats of formations at 298 K, whereas *ab initio* and DFT methods provide total electronic energies E_{tot} as primary results.

Semiempirical heats of formation $\Delta H_{f,\,298\text{ K}}$ at 298 K are calculated as:[S1]

$$\Delta H_{f,\,298\text{ K}} = \sum_{A}^{N_{at}} \Delta H_{f,\,298\text{ K}}\,(A) - E^{\text{SQC-SCF}}_{at,\,298\text{ K}} \tag{1}$$

where N_{at} is the number of atoms in a molecule, $\Delta H_{f,\,298\text{ K}}\,(A)$ denotes the experimental heats of formation of the constituent atoms at 298 K, and $E^{\text{SQC-SCF}}_{at,\,298\text{ K}}$ is the atomization "energy" calculated from the total energies of the molecule and the constituent atoms at the same SQC level of theory. Zero-point vibrational energies (ZPVE) and thermal corrections are not calculated explicitly, but are assumed to be implicitly included in the $E^{\text{SQC-SCF}}_{at,\,298\text{ K}}$ term calculated at the SCF level.

This convention will introduce errors when the resulting SQC heats of formation are used to calculate relative energies, *e.g.* for comparison with *ab initio* and DFT results. These errors will normally remain small for the relative energies of species of similar size, because the ZPVE and thermal corrections will tend to cancel when comparing similar species. This is no longer true for "absolute" energies like atomization energies, for which the corrections do not cancel and can become very large for medium-size and big molecules. For fair comparisons, it is then mandatory to convert the SQC heats of formation (*i.e.* atomization enthalpies at 298 K) to "true" atomization energies. Below we provide a detailed description of the approach used for this purpose.

1.1 Conversion of Semiempirical Atomization Enthalpies at 298 K to ZPVE-Exclusive Atomization Energies

The atomization enthalpy $\Delta H_{at,\ 298\ \mathrm{K}}$ at 298 K and the ZPVE-exclusive atomization energy ΔE_{at} at 0 K are defined by Eqs. 2 and 3, respectively:

$$\Delta H_{at,\ 298\ \mathrm{K}} = \sum_{A}^{N_{at}} \Delta H_{f,\ 298\ \mathrm{K}}\left(A\right) - \Delta H_{f,\ 298\ \mathrm{K}} \tag{2}$$

$$\Delta E_{at} = \sum_{A}^{N_{at}} E_{tot}\left(A\right) - E_{tot} \tag{3}$$

where E_{tot} is the standard total energy (without any corrections).

As can be seen by comparing Eqs. 1 and 2, the semiempirical conventions in the MNDO-based and OMx methods imply that the SCF atomization "energy" represents the atomization enthalpy at 298 K:

$$E_{at,\ 298\ \mathrm{K}}^{\text{SQC-SCF}} = \Delta H_{at,\ 298\ \mathrm{K}} \tag{4}$$

To convert the latter property to ΔE_{at} we need to remove the thermal and ZPVE corrections. Considering the thermal corrections first, the atomization enthalpy at a given temperature T is given by:

$$\Delta H_{at,\ T} = \sum_{A}^{N_{at}} H_T\left(A\right) - H_T \tag{5}$$

The atomization enthalpies at $T = 0$ K and $T = 298$ K are thus related by:

$$\Delta H_{at,\ 0\ \mathrm{K}} = \Delta H_{at,\ 298\ \mathrm{K}} + \Delta H_{298-0} - \Delta H_{298-0}^{atoms} \tag{6}$$

where ΔH_{298-0} is the thermal correction for the enthalpy of the molecule and ΔH_{298-0}^{atoms} is the sum of the corresponding corrections for the constituent atoms. These terms are evaluated

as follows (with $T_{298} = 298.15$ K):

$$\Delta H_{298-0} = E_{trans,\ T_{298}} + E_{rot,\ T_{298}} + E_{vib,\ T_{298}} + RT_{298} \tag{7}$$

$$\Delta H^{atoms}_{298-0} = N_{at}\left(E_{trans,\ 298\ \mathrm{K}} + RT_{298}\right) \tag{8}$$

using the classical limits for translation and rotation and the harmonic oscillator approximation for the vibrational contribution.

The conversion from $\Delta H_{at,\ 0\ \mathrm{K}}$ to ΔE_{at} is accomplished by removing the ZPVE contribution, which is again computed in the harmonic oscillator approximation:

$$\Delta E_{at} = \Delta H_{at,\ 0\ \mathrm{K}} + \mathrm{ZPVE} \tag{9}$$

For fair comparison of various methods it is common practice to perform single-point calculations on reference geometries, which we also do for benchmarking atomization energies at the SQC levels of theory. To correct the semiempirical atomization enthalpies $\Delta H_{at,\ 298\ \mathrm{K}}$ at 298 K to ZPVE-exclusive atomization energies ΔE_{at} at 0 K as described above, we calculate all necessary ZPVE and thermal corrections using the rigid-rotor harmonic-oscillator approximation at geometries optimized at the corresponding SQC level of theory:

$$\begin{aligned}
\Delta E^{SP}_{at} &= \Delta H^{SP}_{at,\ 298\ \mathrm{K}} + \Delta E^{Opt}_{at} - \Delta H^{Opt}_{at,\ 298\ \mathrm{K}} \\
&= \Delta H^{SP}_{at,\ 298\ \mathrm{K}} + \Delta H^{Opt}_{at,\ 0\ \mathrm{K}} + \mathrm{ZPVE}^{Opt} - \Delta H^{Opt}_{at,\ 298\ \mathrm{K}} \\
&= \Delta H^{SP}_{at,\ 298\ \mathrm{K}} + \left(\Delta H^{Opt}_{at,\ 0\ \mathrm{K}} - \Delta H^{Opt}_{at,\ 298\ \mathrm{K}}\right) + \mathrm{ZPVE}^{Opt}
\end{aligned} \tag{10}$$

1.2 Conversion of Other Relative Energies

Corrected relative energies, *e.g.* reaction energies, can simply be calculated from the corresponding atomization energies as they are related through Eq. 3. For a reaction

$$\sum_{i}^{N_{reactants}} M_i \rightarrow \sum_{j}^{N_{products}} M_j \tag{11}$$

the reaction enthalpy at 298.15 K (as obtained from SQC-SCF heats of formation) and the ZPVE-exclusive energy are given by, respectively:

$$\Delta H_{r,\,298\text{ K}} = \sum_{j}^{N_{products}} \Delta H_{f,\,298\text{ K}}\left(M_j\right) - \sum_{i}^{N_{reactants}} \Delta H_{f,\,298\text{ K}}\left(M_i\right) \tag{12}$$

$$\Delta E_r = \sum_{j}^{N_{products}} E_{tot}\left(M_j\right) - \sum_{i}^{N_{reactants}} E_{tot}\left(M_i\right) \tag{13}$$

To calculate the ZPVE-exclusive energy at the SQC level it is sufficient to know the corresponding ZPVE-exclusive atomization energies obtained as described above:

$$\begin{aligned}
\Delta E_r &= \sum_{j}^{N_{products}} E_{tot}\left(M_j\right) - \sum_{i}^{N_{reactants}} E_{tot}\left(M_i\right) \\
&= \sum_{j}^{N_{products}} \left[\sum_{A}^{N_{at}(M_j)} E_{tot}\left(A\right) - \Delta E_{at}\left(M_j\right) \right] \\
&- \sum_{i}^{N_{reactants}} \left[\sum_{A}^{N_{at}(M_i)} E_{tot}\left(A\right) - \Delta E_{at}\left(M_i\right) \right] \\
&= \sum_{A}^{N_{at,\ all}} E_{tot}\left(A\right) - \sum_{j}^{N_{products}} \Delta E_{at}\left(M_j\right) \\
&- \sum_{A}^{N_{at,\ all}} E_{tot}\left(A\right) + \sum_{i}^{N_{reactants}} \Delta E_{at}\left(M_i\right) \\
&= - \left[\sum_{j}^{N_{products}} \Delta E_{at}\left(M_j\right) - \sum_{i}^{N_{reactants}} \Delta E_{at}\left(M_i\right) \right]
\end{aligned} \tag{14}$$

a N.L.Haworth, M.H.Smith, G.B.Bacskay, and J.C.Mackie, J.Phys.Chem.A 104, 7600 (2000).

Notes: (i) SCF convergence criteria were decreased to iscf=iplscf=7 for calculations of $CF_3O\cdot$ with MNDO, OM3, OM3-D2, OM3-D3, OM3-D3T; (ii) SCF convergence criteria were decreased to iscf=iplscf=7 for calculations of $CF_3C\cdot$ with MNDO; (iii) SCF convergence criteria were decreased to iscf=iplscf=6 and convergence criterion for optimization (gradient norm) was decreased to 1.0 kcal/(mol·Å) for calculations of FCOO· with OM1 (in this case EF optimization algorithm was used instead of BFGS).

a A.Karton, S.Daon, J.M.Martin, Chem.Phys.Lett. 510, 165 (2011).

Note: SCF calculations of the CCH· radical during thermochemical calculations could not be converged with many methods with tight SCF convergence criteria, thus criteria for both energy and density matrix were reduced to 10^{-6}.

Table S20: Benchmark Results for the GMTKN30-CHNOF Data Set. Energies (kcal/mol). In the Column "Species" Is Given Only One of the Species, Energy of Which Was Used to Derive Final Energy. The Same Species May Be Involved in Different Relative or Reaction Energies, Thus Check Reference Value to Attribute Each of Entries to Specific Reaction in GMTKN30 Set

G.I.Csonka, A.D.French, G.P.Johnson, and C.A.Stortz, J.Chem.Theory Comput. 5, 679 (2009).															

Notes: (i) SCF calculations of the $C_2H\cdot$ radical during thermochemical calculations (for correcting the W4-08 and W4-08woMR subsets energies) could not be converged with many methods with tight SCF convergence criteria, thus criteria for both energy and density matrix were reduced to 10^{-6}. Similarly, convergence criteria were reduced for many artificial molecules in the MB08-165 subset. (ii) We were able to converge SCF for C_{20} isomers to lower electronic energy than in Ref. S3, thus our values are somewhat lower.

Table S21: Benchmark Results for the CE345-CHNOF Data Set. Energies (kcal/mol). In the Column "Species" Is Given Only One of the Species, Energy of Which Was Used to Derive Final Energy. The Same Species May Be Involved in Different Relative or Reaction Energies, Thus Check Reference Value to Attribute Each of Entries to Specific Reaction in CE345 Set

Notes: SCF calculations of the CCH· and CH_3CO· radicals during thermochemical calculations (for correcting the MGAE109 subset energies) could not be converged with many methods with tight SCF convergence criteria, thus criteria for both energy and density matrix were reduced to 10^{-7}.

a Taken from the experimental data quoted in: J.J.P.Stewart, J.Comput.Chem. 10, 221 (1989).

Table S24: Benchmark Results for the PM7-CHNOF Data Set. Heats of Formation (kcal/mol). Numbering of Molecules Is from the Web Database; If Several Entries for the Same Molecule Are Given Under Different Numbers, We Assign the Lowest Number to This Molecule. Molecules #704, 732, 1495, 943 and 1246 from PM7 Database Were Excluded from the Analysis as No References Were Provided on the Web Database for Indicated Heats of Formation of 0.0 kcal/mol. Enthalpy of Formic Acid Dimer #1376 (−13.9 kcal/mol, #1377 in the Web Database) Given in the Web Database Does not Correspond to Its Heat of Formation, but to Dimerization of Formic Acid. Heat of Formation of Formic Acid Dimer Is Thus Calculated as $\Delta H_f = -13.9 + 2\Delta H_f$(formic acid), Where Heat of Formation of Formic Acid ΔH_f(formic acid) = −90.5 kcal/mol Is Taken from #1052 Entry of the Same Web Database.

4 Figures: Error Distributions and Reference and Optimized SQC Geometries of Selected Noncovalent Complexes

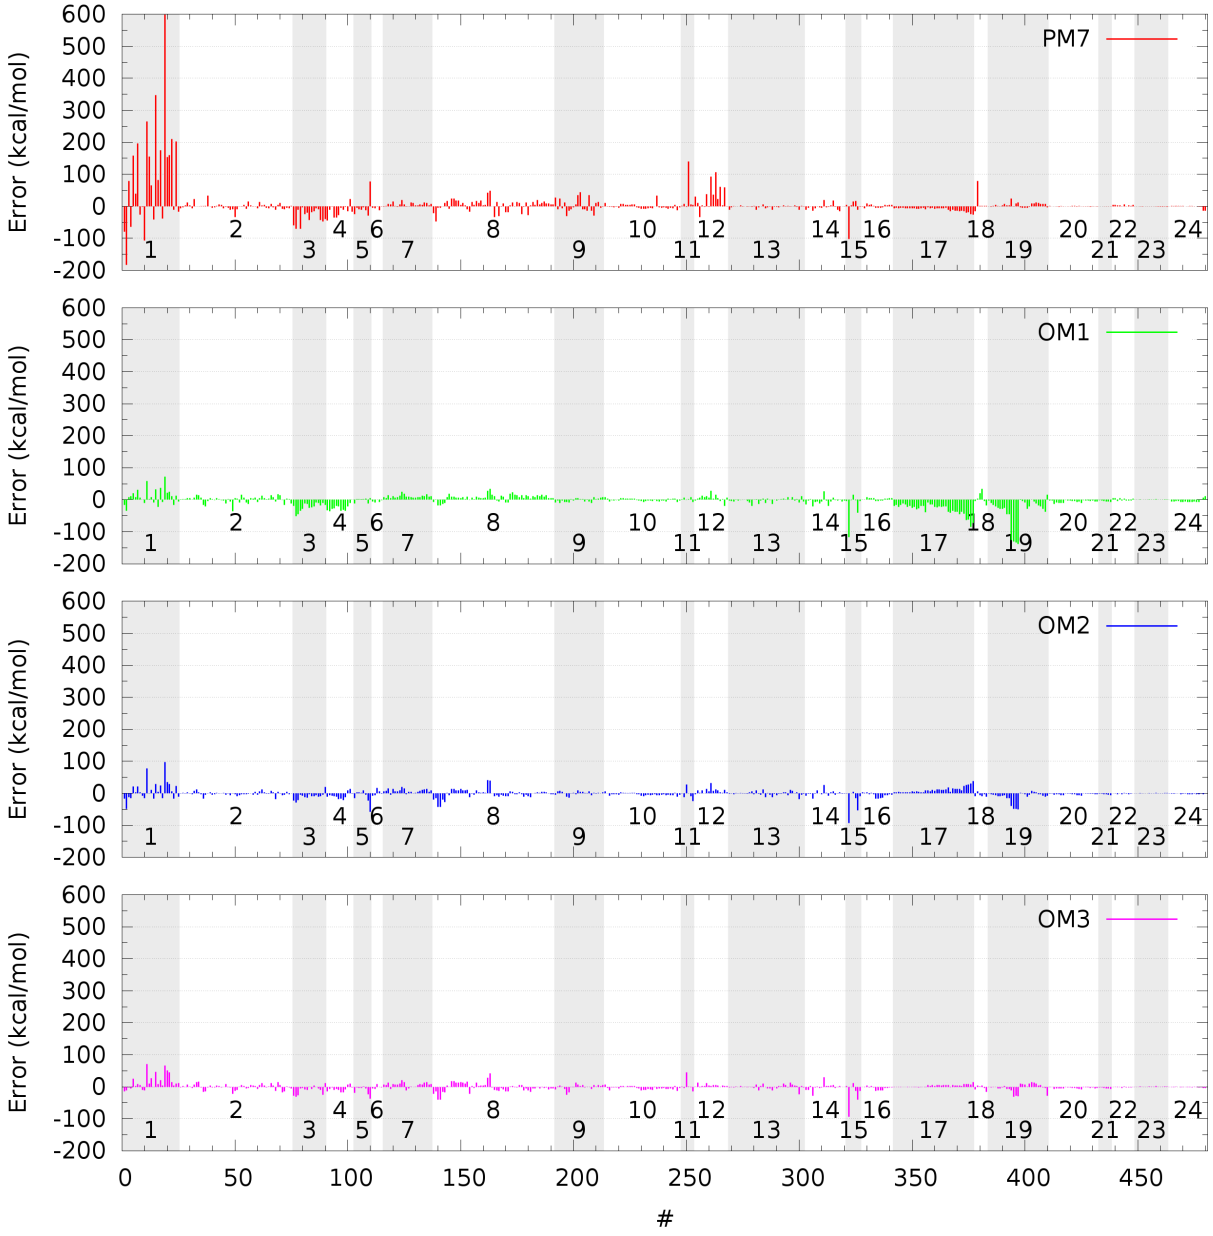

Figure S1: Error distribution of ground-state properties calculated at the OMx and PM7 levels of theory for the GMTKN30-CHNOF benchmark set (including the MB08-165 subset and the isomerization energy of C_{20}). The subsets are marked with alternating gray and white backgrounds and their numbers correspond to those in Table 6 in the main text.

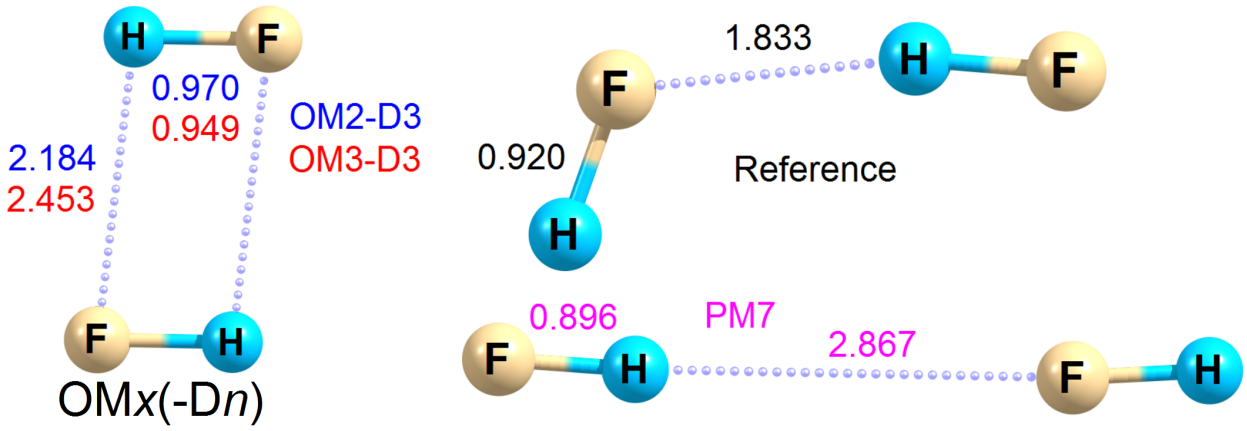

Figure S2: Reference geometry of the HF dimer from the A24 benchmark set (top right) and geometries optimized at OM2, OM3, and OMx-Dn (left) and PM7 (bottom right). Selected interatomic distances are shown in Ångstrom for the reference (black), OM2-D3 (blue), OM3-D3 (red), and PM7 (pink) geometries.

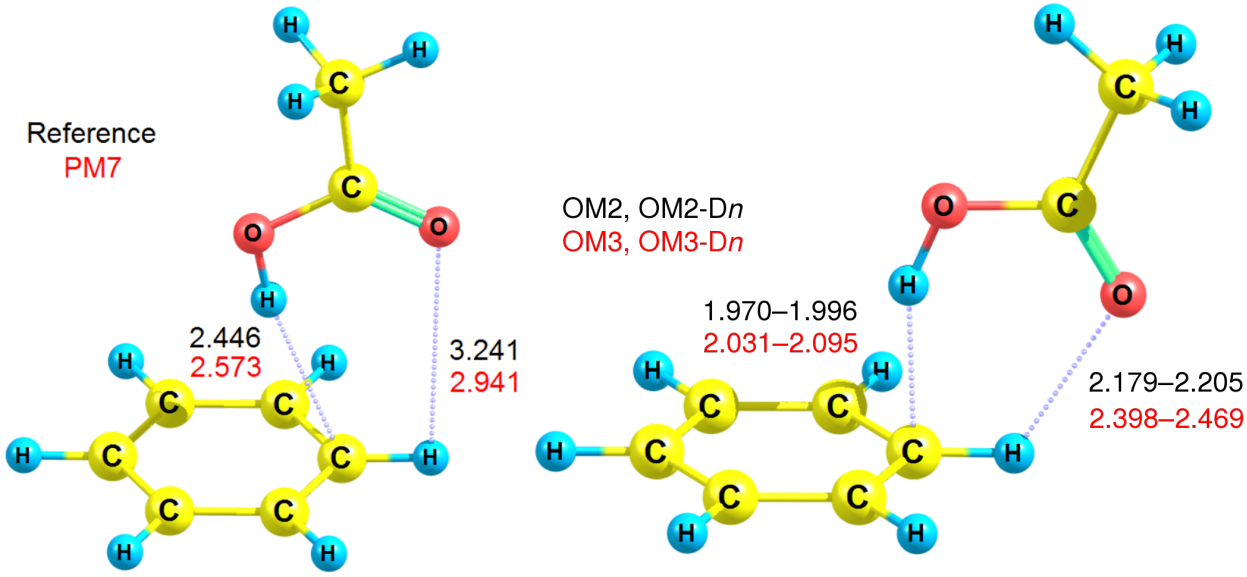

Figure S3: Reference and PM7 geometries of the benzene$\cdots$AcOH (OH-π) complex from the S66 benchmark set (left) and geometries optimized at OM2, OM3, and OMx-Dn (right). Selected interatomic distances are shown in Ångstrom. The $C_6H_5{-}H\cdots O{=}C(OH)CH_3$ intermolecular distance is too short by 0.821...1.062 Å in the OMx-Dn geometries.

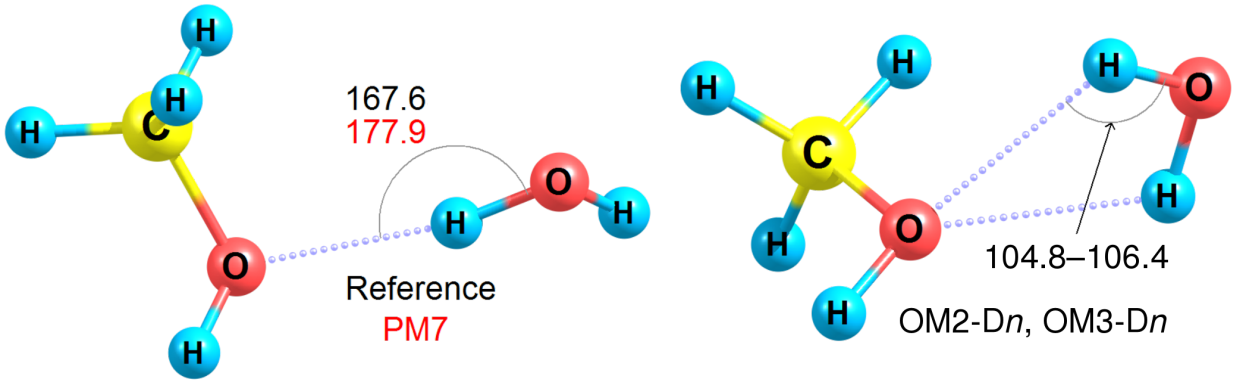

Figure S4: Reference, OMx-Dn, and PM7 geometries of the $H_2O \cdots MeOH$ complex from the S66 benchmark set. Selected angles are shown in degrees.

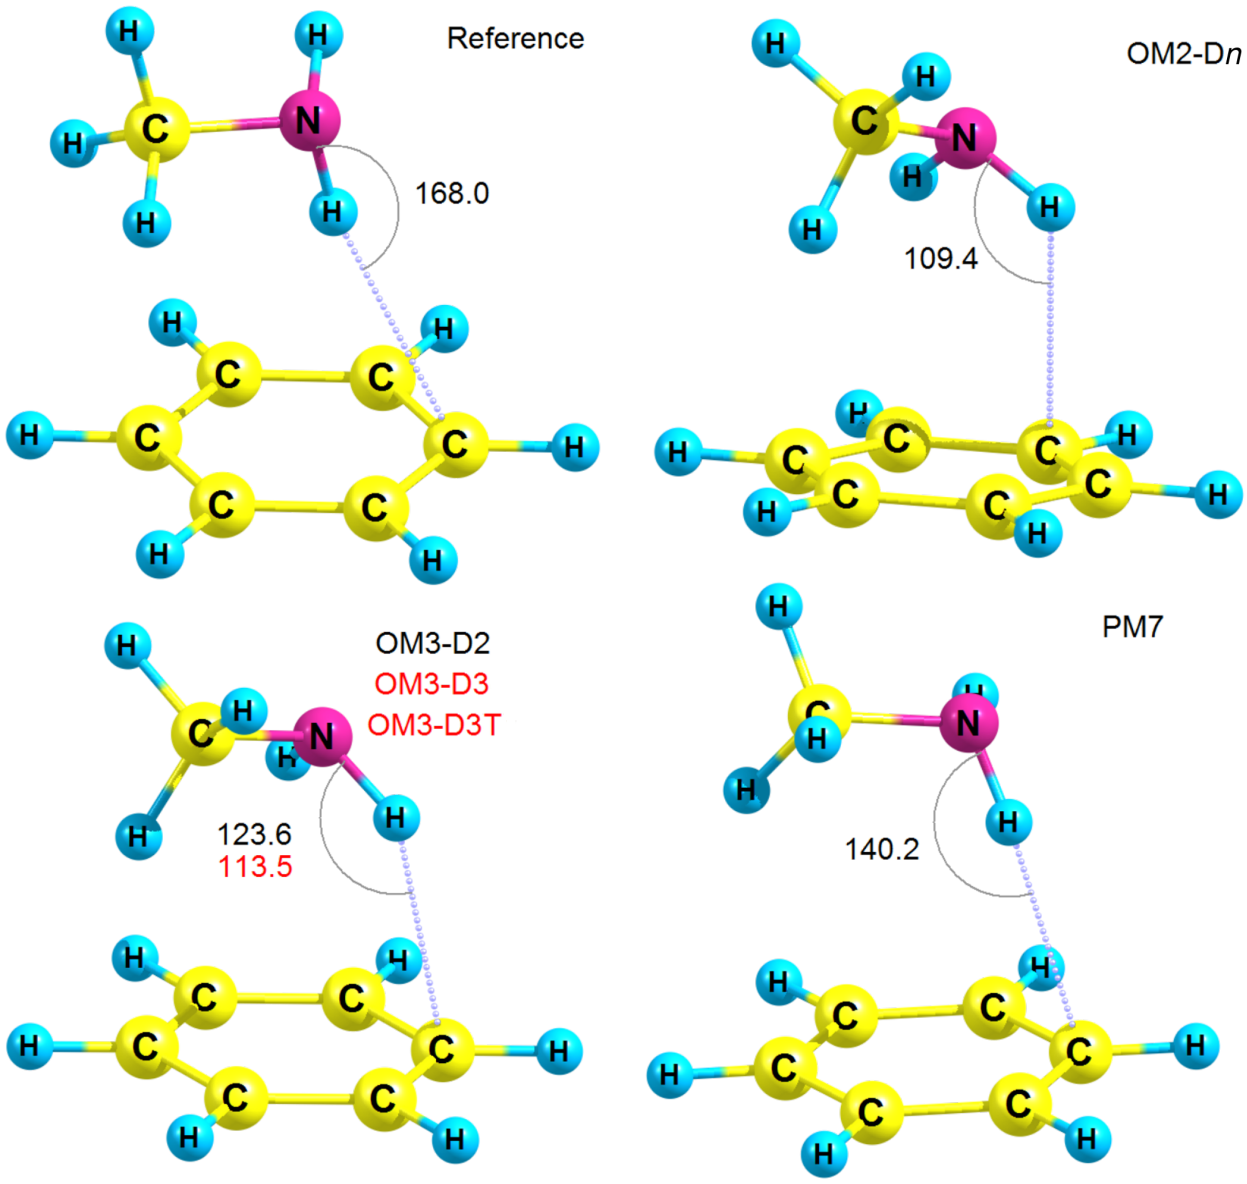

Figure S5: Reference, OMx-Dn, and PM7 geometries of the $C_6H_6 \cdots MeNH_2$ complex from the S66 benchmark set. Selected angles are shown in degrees.

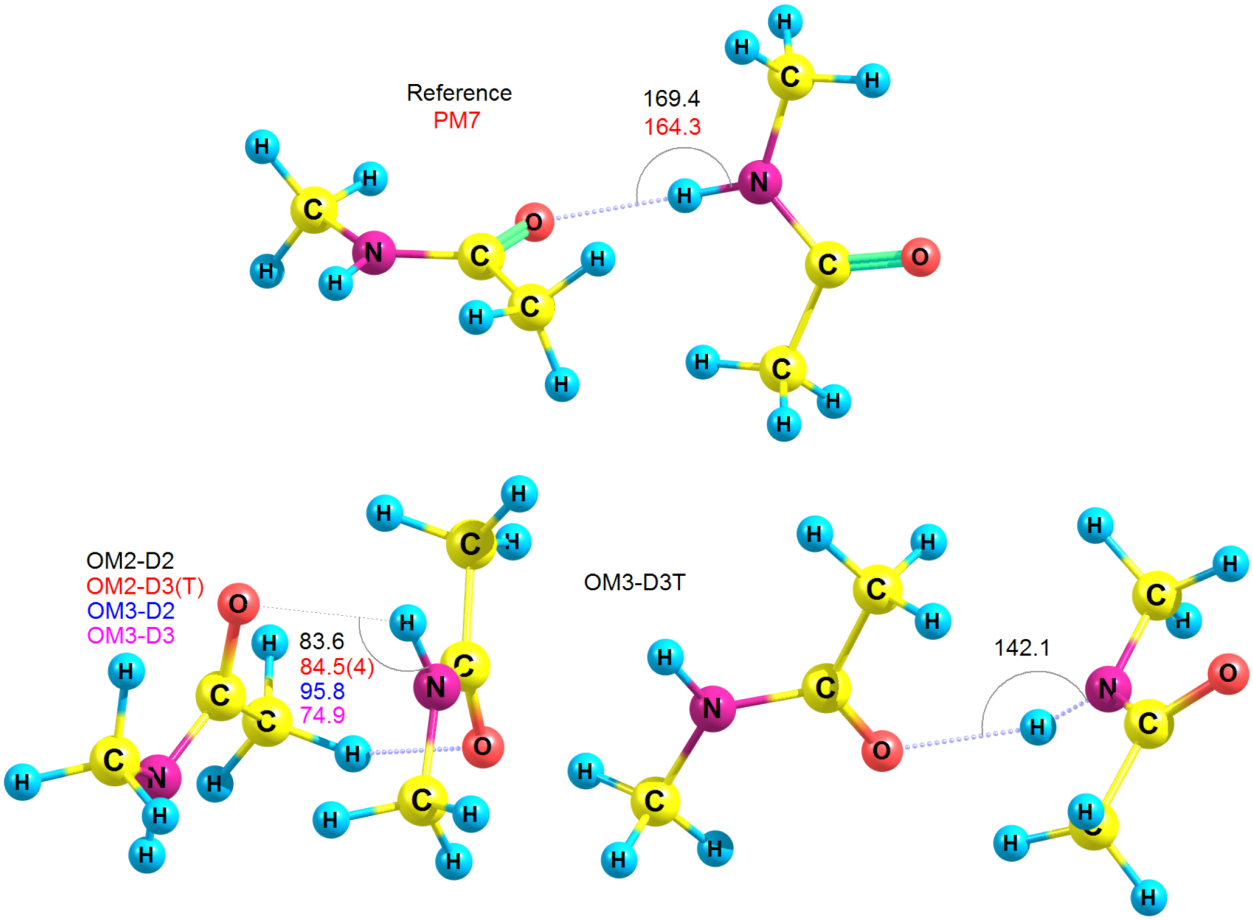

Figure S6: Reference, OMx-Dn, and PM7 geometries of the peptide$\cdots$peptide complex from the S66 benchmark set. Selected angles are shown in degrees.

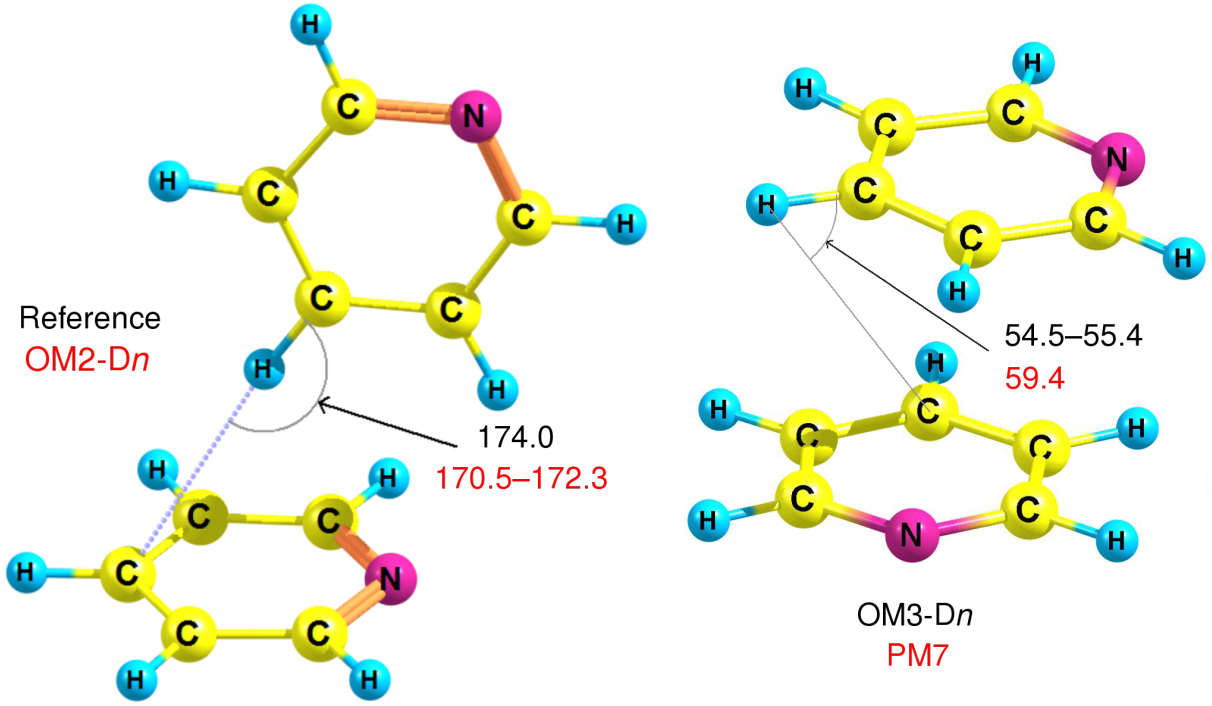

Figure S7: Reference and OM2-Dn geometries of the T-shaped pyridine dimer (left) from the S66 benchmark set and geometries optimized at PM7 and OM3-Dn (right). Selected angles are shown in degrees.

5 Additional Statistical Evaluations for RM1

The RM1 method is a reparametrization of the AM1 method. According to the following statistical evaluations, it tends to be generally more accurate than AM1, about as accurate as the PMx methods, and somewhat less accurate than the OMx methods.

Heats of formation are used as reference data in 12 benchmark sets. RM1 is superior to AM1 in 10 of these sets: Cations41, BIGMOL20, Conformers30, Isomers44, and Fluorine91 (Table S34), G2, G3, and Alkanes28 (Table S35), PDDG (Table S39), and PM7-CHNOF (Table S40), while the opposite is true for Radicals71 and Anions24 (Table S34). PM7 and the OMx methods are generally more accurate than RM1, in particularly OM2 and OM3, which have smaller or essentially equal mean absolute errors (MAEs) in 11 out of 12 cases (all except Conformers30).

For atomization energies, RM1 is generally more accurate than AM1, but less accurate than PM7 and OMx (see the results for the TAE140 and TAE_nonMR124 sets in Table S36, for W4-08 and W4-08woMR in Table S37, for MGAE109/11 in Table S38, and for C7H10O2 in Table S41). Taking the TAE140 set as an example, the MAEs for AM1, RM1, PM7, OM2, and OM3 are 9.09, 8.83, 6.51, 4.81, and 6.47 kcal/mol, respectively.

For the large variety of molecules and properties covered by the GMTKN30-CHNOF set (Table S37) and by the CE345-CHNOF set (Table S38), RM1 tends to perform better than AM1 and the PMx methods, but less well than the OMx methods. According to the overall statistics for GMTKN30-CHNOF, the MAEs for AM1, RM1, PM7, OM2, and OM3 are 16.45, 12.43, 16.49, 7.94, and 7.17 kcal/mol, respectively. The corresponding MAEs for CE345-CHNOF are 10.08, 9.31, 10.85, 6.40, and 6.89 kcal/mol, respectively.

Table S34: Mean Absolute Errors in Calculated Heats of Formation (kcal/mol), Relative Energies (kcal/mol), Ionization Potentials (eV), Barriers (kcal/mol), Bond Lengths (Å), and Bond Angles (degree) for the OVS7-CHNOF Benchmark Set: MNDO, AM1, RM1, PMx, and OMx

[a] (corr.) means that energies are obtained by removing ZPVE and thermal corrections from the SQC results (see text). [b] Without MB08-165 and C20. [c] Upon geometry optimization, some of the artificial molecules adopted structures very different from the reference geometries so that the computed corrections may be less accurate in these cases (see text). [d] Subset W4-08 without multireference cases. [e] The adduct O_3+C_2H_2 is better described as open-shell singlet at OMx-Dn. [f] Subset DC9 without C_{20} bowl/cage isomerization energy. [g] C_{20} bowl/cage isomerization energy. [h] For some SQC methods the corrections suffer from large accumulation errors (see text). [i] Reference dissociation energies of four $(H_2O)_{20}$ clusters were updated with more accurate values from Ref. S4 (see text).

[a] (corr.) means that energies are obtained by removing ZPVE and thermal corrections from the SQC results (see text). [b] SCF calculations of the $NH_3 \cdots F_2$ complex in the NCCE31 subset could not be converged with OM2 and OM3; thus we excluded this complex from the statistics.
