Supplemental Figure S9. Sequence alignments of the break site flanking sequences of the different type of events repaired through non-homologous end joining after metal treatments. The different types of NHEJ repair events were classified as having no microhomology (no MH), having insertions, having microhomology (MH) or other (not shown). The alignments show the flanking region of the break site with are different features highlighted: Insertions (blue) and MH (yellow). The deleted region is represented by the light blue sequences within the brackets. The size of the deletion is shown on the right in red.
