

Sex and Diagnosis Specific Associations Between DNA Methylation of the Oxytocin Receptor Gene with Emotion Processing and Temporal-Limbic and Prefrontal Brain Volumes in Psychotic Disorders

Supplemental Information

Table S1. OXTR DNA methylation levels in individuals with psychotic disorders as a function of antipsychotics and anticonvulsant/mood stabilizers

	OXTR DNA Methylation				
	Yes		No		<i>p</i> -Value
	<i>n</i>	M (SD)	<i>n</i>	M (SD)	
Antipsychotics	134	47.57 (6.64)	33	49.71 (7.57)	0.10
First generation	20	46.81 (7.66)	147	48.15 (6.76)	0.41
Second generation	120	47.58 (6.58)	47	49.04 (7.51)	0.22
Aripiprazole	33	49.37 (6.11)	134	47.65 (7.01)	0.20
Clozapine	2	52.65 (0.99)	165	47.94 (6.88)	0.33
Olanzapine	11	45.33 (5.61)	156	48.18 (6.92)	0.18
Quetiapine	20	45.72 (5.65)	147	48.30 (6.97)	0.11
Risperidone	18	48.11 (8.15)	149	47.98 (6.72)	0.94
Ziprasidone	10	46.29 (6.77)	157	48.10 (6.87)	0.42
Anticonvulsant/mood stabilizer	86	46.80 (7.63)	81	49.26 (5.72)	0.02
Lithium	24	45.44 (6.66)	143	48.42 (6.82)	0.04
Valproic acid	26	45.85 (7.67)	141	48.39 (6.66)	0.08

Table S2. Regional brain volumes (mm³) in *a priori* regions of interest based on their relation to social cognition in women and men with and without psychotic disorders

** $p < 0.01$; * $p < 0.05$; ^T $p > 0.05$ and $p \leq 0.09$.

Scz, schizophrenia; SczA, schizoaffective; BP, psychotic bipolar.

Adjusted for age, race, and total intracranial volume. In multivariable regression analyses, in women, the association between peripheral OT levels and brain regions differed by group, with significant peripheral OT level x group interactions in some brain regions. Specifically, an OT level x group interaction was observed in the right fusiform gyrus ($p = 0.004$). This interaction was driven by effects in all patient groups, with the exception of females with schizophrenia. Higher peripheral levels of OT were associated with smaller volumes in the right fusiform gyrus in healthy controls ($\beta = -0.36$, $p = 0.004$) and females with schizoaffective ($\beta = 0.66$, $p = 0.01$) and psychotic bipolar disorder [trend, $\beta = -0.23$, $p = 0.06$]. In men, an OT levels x group interaction was significant in the right parahippocampal gyrus ($p = 0.01$) with a similar trend in the left parahippocampal gyrus ($p = 0.06$). These associations were driven primarily by the male controls in whom higher levels of OT were associated with smaller volumes in the right ($\beta = -0.51$, $p = 0.004$) and left parahippocampal gyri ($\beta = -0.54$, $p = 0.002$).
