* Relative abundances were obtained from the ‘Human, PaxDB integrated dataset’ in the PaxDB database (Wang et al. 2012). An estimate of 3×10^6 proteins per μm^3 is given by Milo (2013). This gives an estimated total protein concentration of $\frac{3 \times 10^{24}}{6.022 \times 10^{23}} \approx 5 \text{ mM}$ (1 ppm = 5 nM).
