

Supplementary Table 1

Supplementary Table 1. The day of symptom onset in 1088-infected mice received the post-exposure T-705 administration for 7 days.

Treatment	n	The day of symptom onset (mean \pm SD)
0.5% methylcellulose (control)	8	8.25 \pm 1.17
T-705: 30 mg/kg/day	8	10.00 \pm 1.60
T-705: 100 mg/kg/day	6	9.83 \pm 1.33
T-705: 300 mg/kg/day	4	11.75 \pm 3.30

The data were extracted from Figure 3.

A significant difference was only detected between the control and 300 mg T-705/kg/day groups ($P < 0.05$, Tukey's multiple comparisons test).
