Supplemental Figures

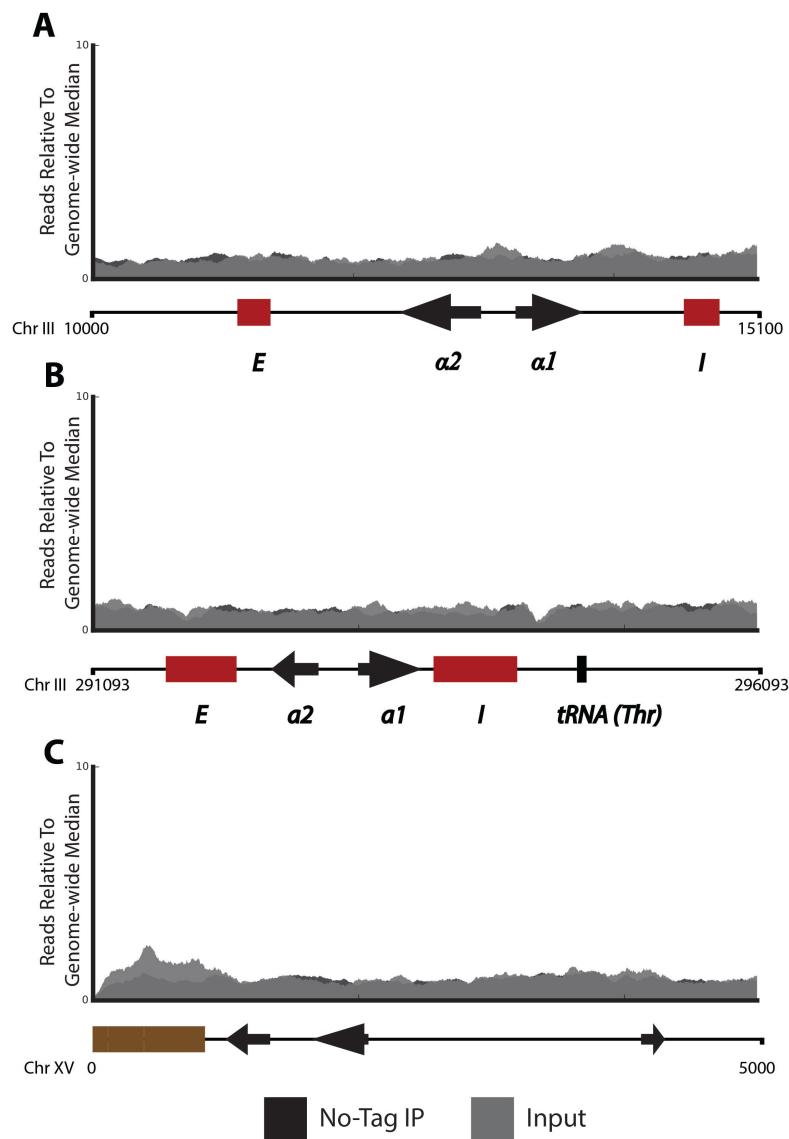

Figure S1. No tag IP and input enrichment in *S. cerevisiae*. No tag IP and input tracks shown for *S. cerevisiae* at *HMLα* (A), *HMRα* (B), and *TEL15L* (C). IP shown in black, input in gray, in terms of reads relative to genome-wide median.

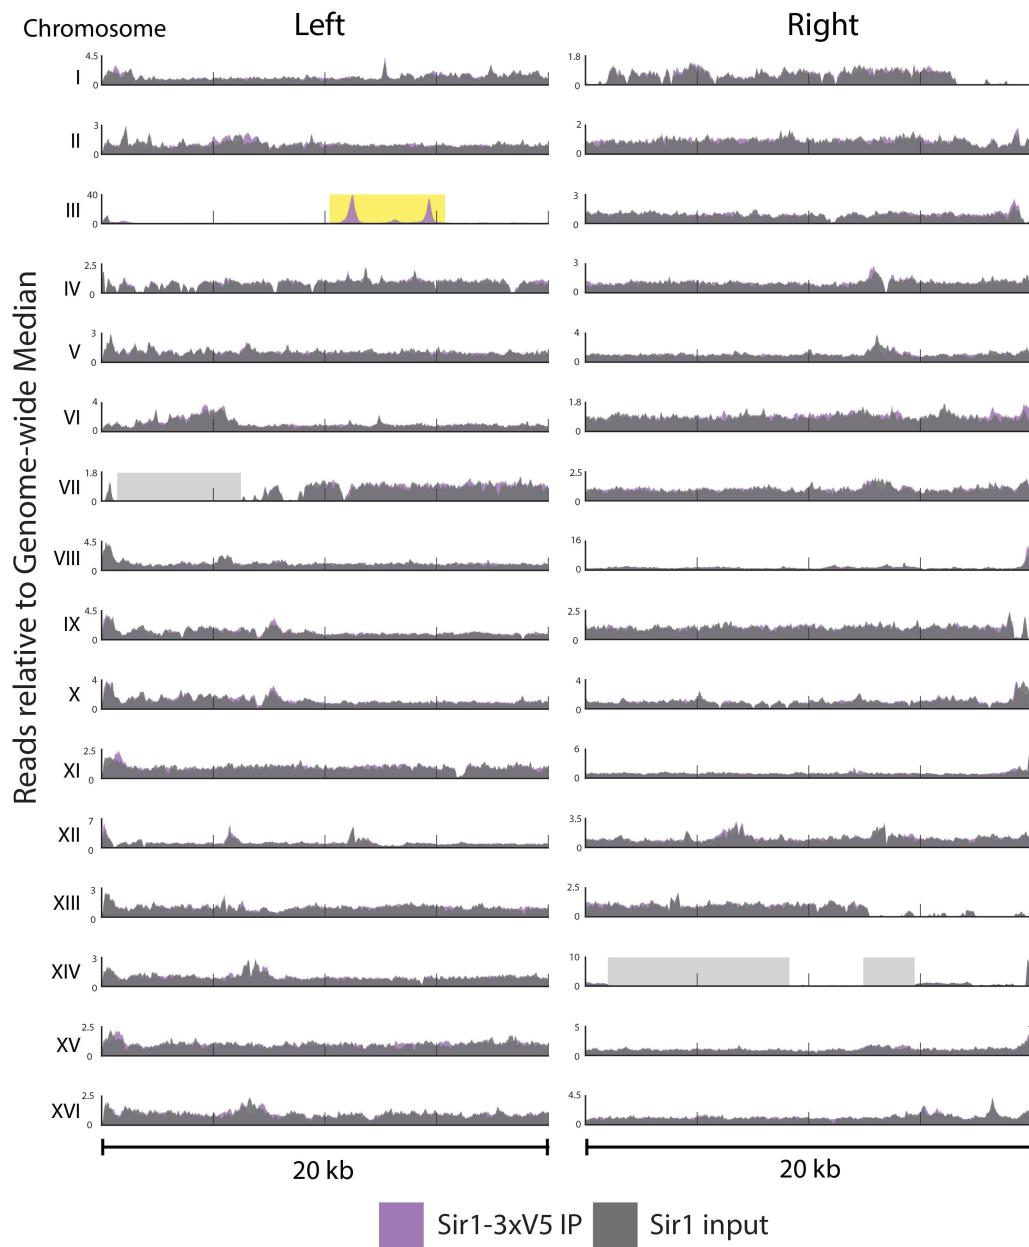

Figure S2. Lack of Sir1 enrichment at 31 out of 32 *S. cerevisiae* telomeres (W303 strain). Sir1 IP shown in purple, input shown in gray. Sir1 enrichment is seen at *HML α* on *TEL03L* (yellow box). 20kb inward from the left and right ends of each chromosome is shown. Regions deleted in the W303 strain relative to S288C are shown in gray.

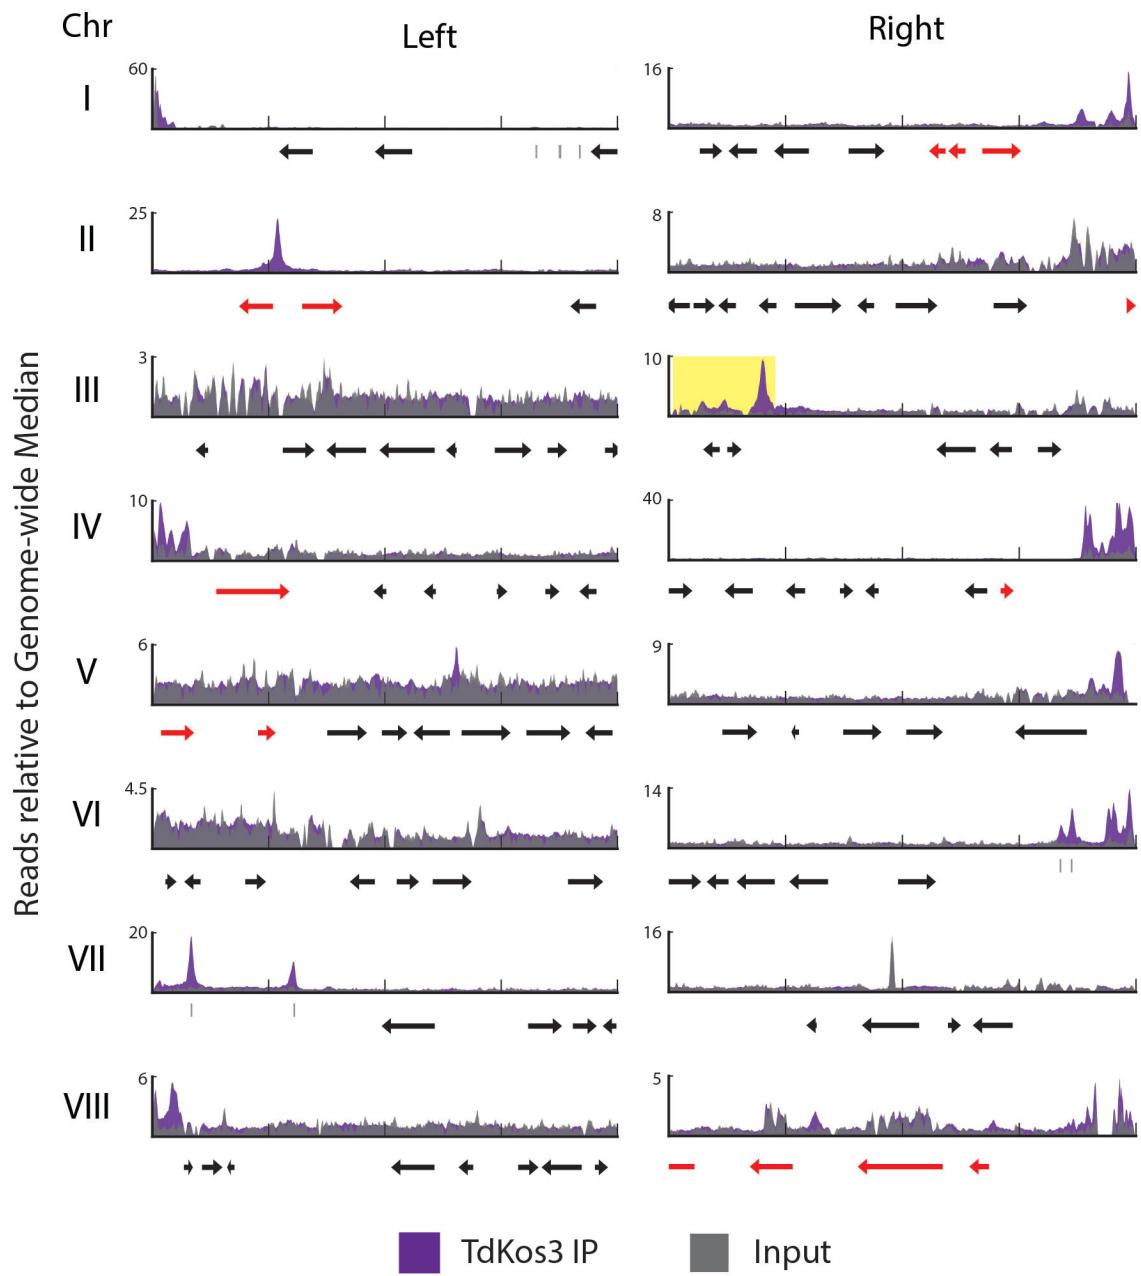

Figure S3. Enrichment of Kos3 (dark purple) at eleven telomeres in *T. delbrueckii*:
TEL01L, TEL01R, TEL02L, TEL03R, TEL04L, TEL04R, TEL05R, TEL06R, TEL07L, TEL08L, and TEL08R. Open reading frames (ORFs) are depicted in black arrows and tRNA genes are depicted in gray boxes. *HML* on *TEL03R* is boxed in yellow. Subtelomeric

genes that significantly increased in expression in all three *sir* mutants relative to wild type are shown as red arrows. Enrichment patterns for Td-Sir2 and Td-Sir4 were highly similar.

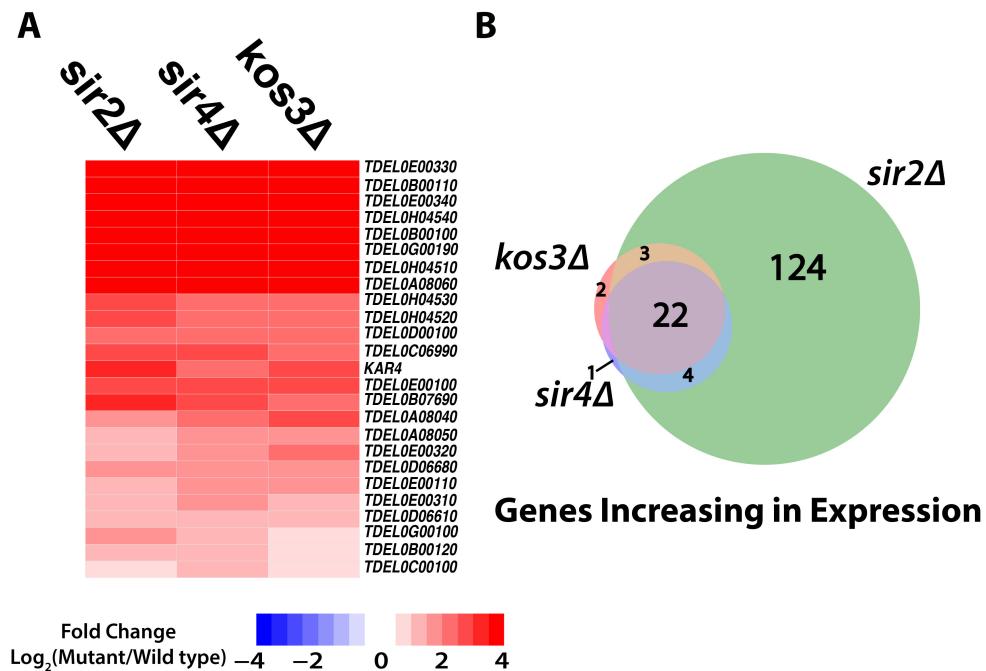

Figure S4. Summary of genes that significantly increased in expression in all three *sir* mutants in *T. delbrueckii* (*kos3Δ*, *sir2Δ*, and *sir4Δ*). (A) Heatmap of all genes that increased significantly relative to Wild type (red boxes) across all three mutants. (B) Venn diagram showing overlap of all genes that significantly increased in *kos3Δ*, *sir2Δ*, and *sir4Δ*. Genes whose expression increased in *kos3Δ* and *sir4Δ* were largely a subset of those whose expression increased in *sir2Δ*; suggesting that *SIR2* regulates many other genes in addition to the genes at telomeres, *HML* and the two copies of *HMR* in *T. delbrueckii*.

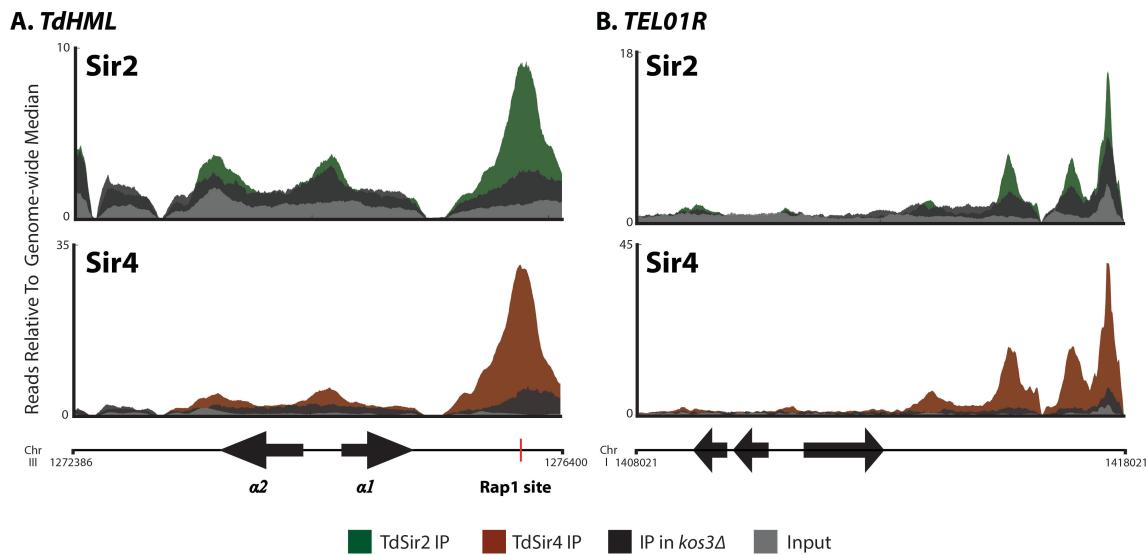

Figure S5. Sir2 and Sir4 had reduced enrichment at *HML* (A) and a representative telomere, *TEL01R* (B) in *kos3Δ* strains. Enrichment in *KOS3* wild-type strains for Sir2 and Sir4 shown in green and brown, respectively. Enrichment of Sir2 and Sir4 in the *kos3Δ* strain is shown in black. The signal from input chromatin is shown in gray. Genes are marked with black arrows; Rap1 site at *HML* is marked with red line.

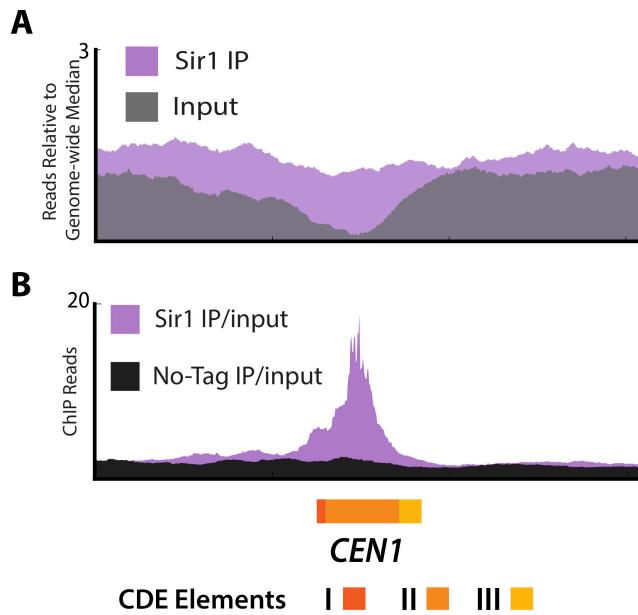

Figure S6. Under-enrichment of IP and input at *S. cerevisiae* centromeres. (A) Enrichment of Sir1 IP and input shown separately at *CEN1*. The input appears under-enriched. (B) Enrichment of Sir1 at *CEN1* viewed as IP over input. The No-tag negative control IP over input is shown in black.

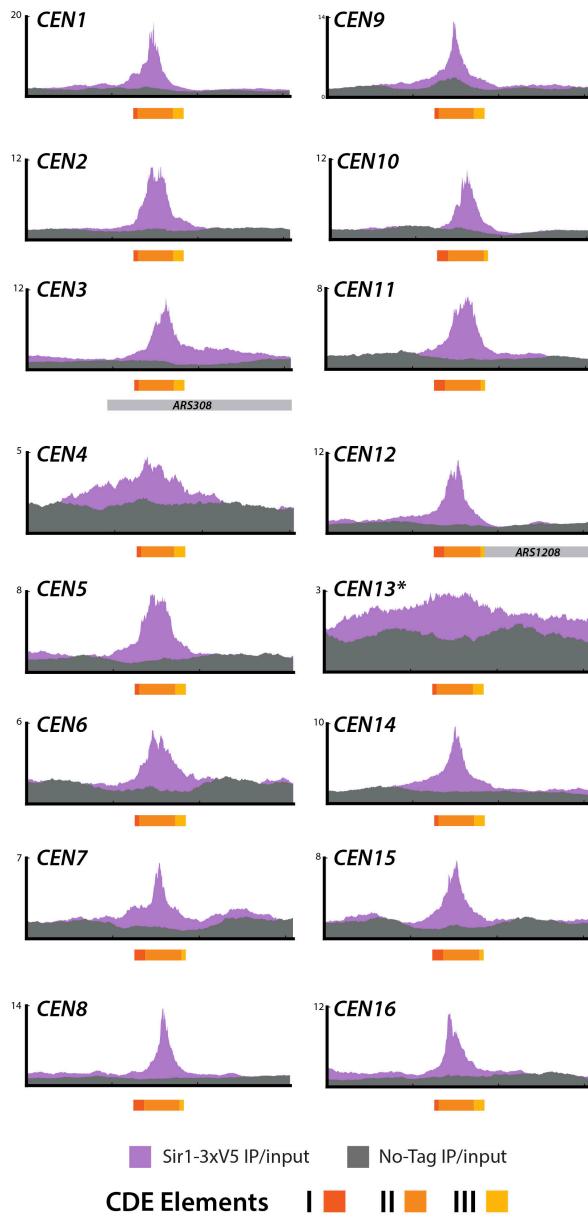

Figure S7. Sir1 enrichment at all 16 centromeres in *S. cerevisiae*. Enrichment is shown as IP over input. IP over input of the no-tag control is shown in gray. *The enrichment seen at *CEN13* is likely to be non-specific, as its enrichment was not greater than the IP over input of GFP-NLS, a protein expected to non-specifically bind in the genome. Centromere sequence elements, CDE I, CDE II, and CDE III are marked with red orange, orange, and yellow boxes, respectively.

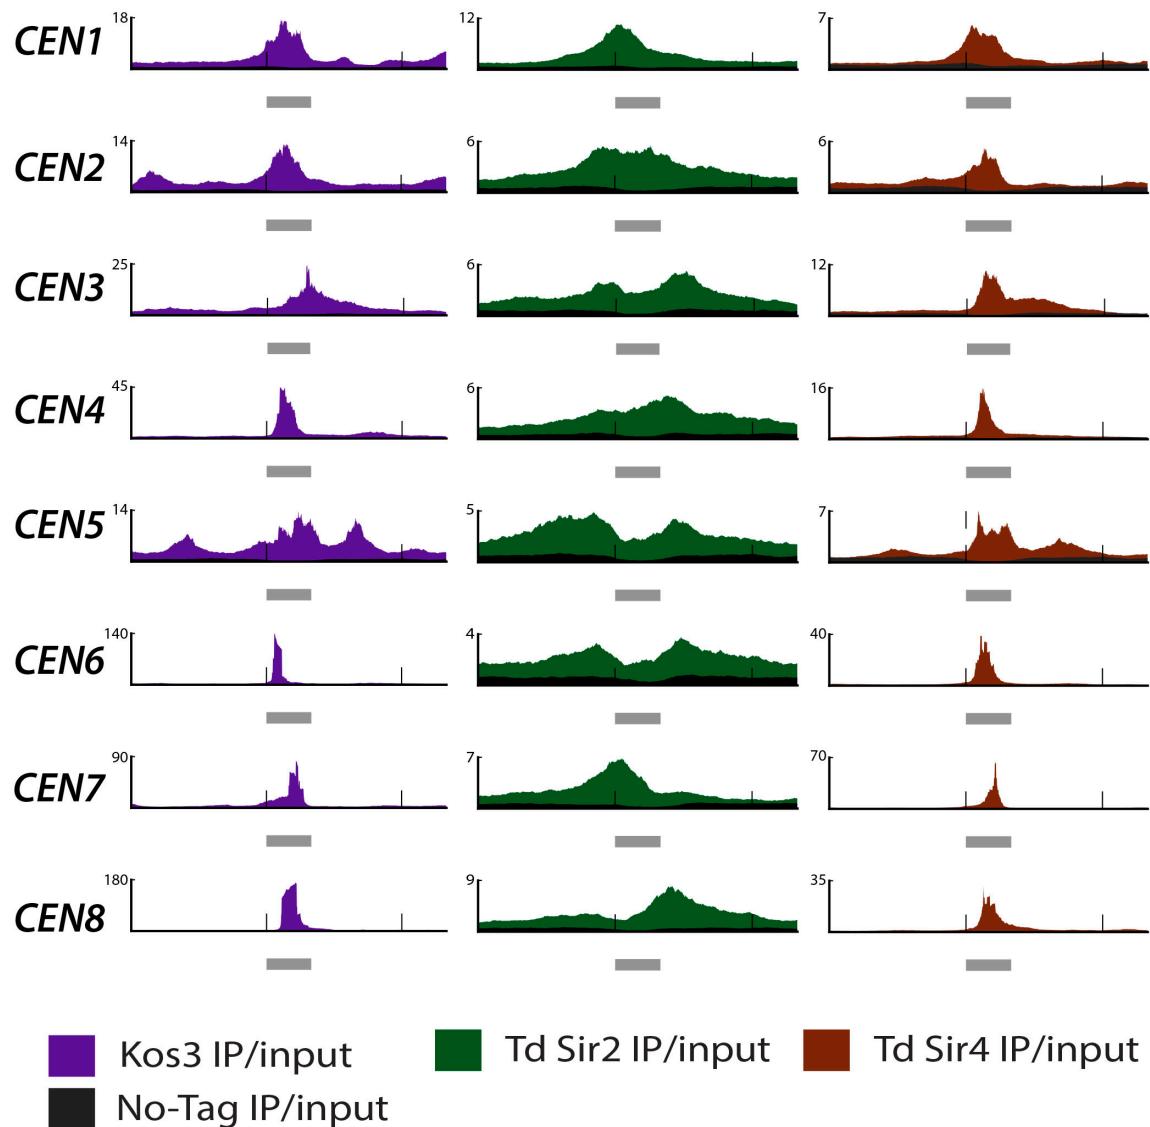

Figure S8. Enrichment of Kos3, Sir2, and Sir4 at all 8 *T. delbrueckii* centromeres. Enrichment is shown as IP/input (centromeres marked with gray boxes; tick marks represent 500 base pairs). Functionality of two centromeres, *CEN1* and *CEN3*, was confirmed experimentally.

Supplementary Tables

Table S1 Strains Used In This Study

*Unless otherwise indicated, strains were constructed for this study.

Table S4 Genes Increasing and Decreasing in Expression Relative to Wild Type in *T. delbrueckii sir2Δ* mutant

Shown below are statistically significant expression changes that occurred in the *sir2Δ* mutant relative to Wild type. GO term analysis revealed some genes that function in meiosis (*) and carbohydrate metabolism (**). Genes that specifically increased in only in the *sir2Δ* mutant and were located near a statistically significant Td-Sir2 peak are marked(‡).

Table S8 Genes Increasing and Decreasing in Expression Relative to Wild Type in *T. delbrueckii ago1Δdcr1Δ* Mutant

A total of 15 genes increased in expression, while 36 genes decreased in expression (excluding *AGO1* and *DCR1* themselves, which were deleted). Statistically significant associated GO terms are starred: *oxidation-reduction process and **small molecule metabolism.

Table S9 Genes Increasing In Expression in *T. delbrueckii* *sir* Mutants

Listed below are twenty-two subtelomeric genes and silent mating type loci genes that were de-repressed in all three *T. delbrueckii* *sir* mutants. Many subtelomeric genes on the same telomeric arm are adjacent to each other (for example, *TDEL0B00100* and *TDEL0B00110*). For those genes that have *S. cerevisiae* orthologs, the *S. cerevisiae* systematic name and three-letter name is provided.

<i>T. delbrueckii</i> Gene	<i>S. cerevisiae</i> ortholog	Wild type FPKM	<i>kos3Δ</i> FPKM	<i>sir2Δ</i> FPKM	<i>sir4Δ</i> FPKM	Description
