

Supplemental material

The composition of airborne and grain-dust fungal communities is shaped at regional scale by plant genotypes and farming practices

Loïc Pellissier, Anne Oppliger, Alexandre H. Hirzel, Dessislava Savova-Bianchi, Guilain Mbayo, Fabio Mascher, Stefan Kellenberger, Hélène Niculita-Hirzel

The following Supporting Information is available for this article:

Fig. S1. Number of freezing days (A.) and elevation (B.) in the study area.

Fig. S2. Climatic information. A. Location of the weather stations. B., D., F. Mean precipitation levels during June, July and August 2010, respectively. C., E., G. Mean temperatures during June, July and August 2010, respectively.

Table S1. Fungicide treatments of the fields

Table S2. Weather indicators during aerosol sampling and duration of sampling

Table S3. Variables considered in the analysis of fungal alpha and beta diversity

Table S4. Good's coverage values and sequence data characteristics of samples

Table S5. Taxonomic assignment of the OTUs. The species known to be involved in wheat diseases or to produce secondary metabolites that are toxic for humans (mycotoxins) are mentioned when the OTUs present a sequence identity >96%.

Table S6. Frequency of the OTUs with at least two reads in aerosol and grain dust samples depending on the farming system

FIG S1.

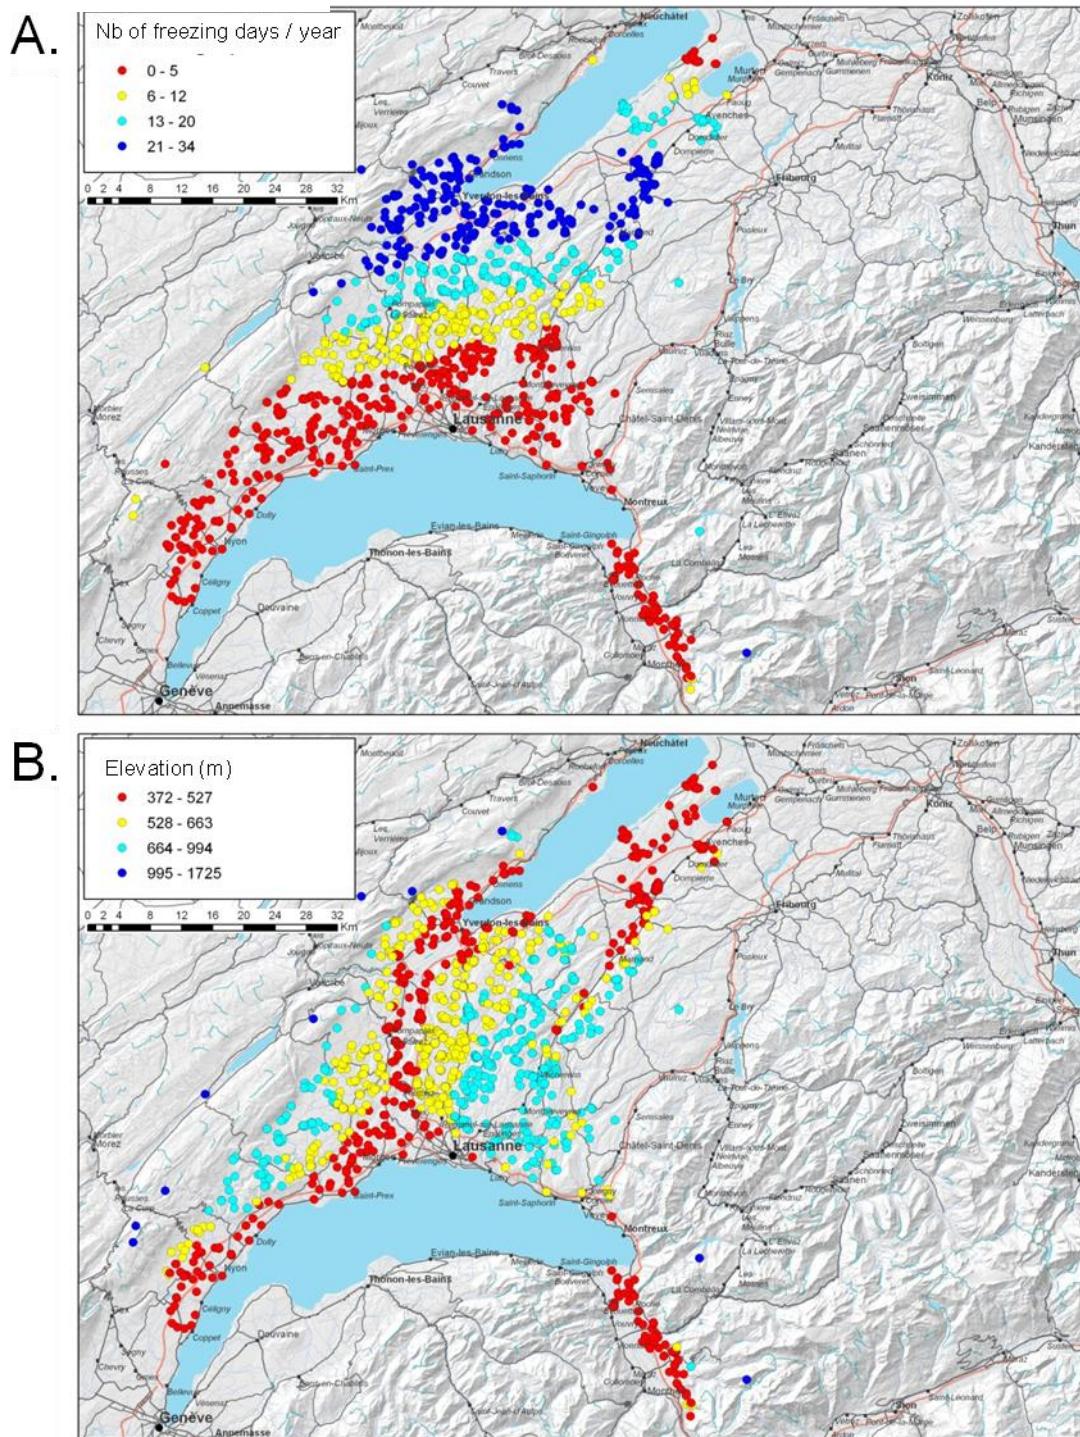

FIG S2.

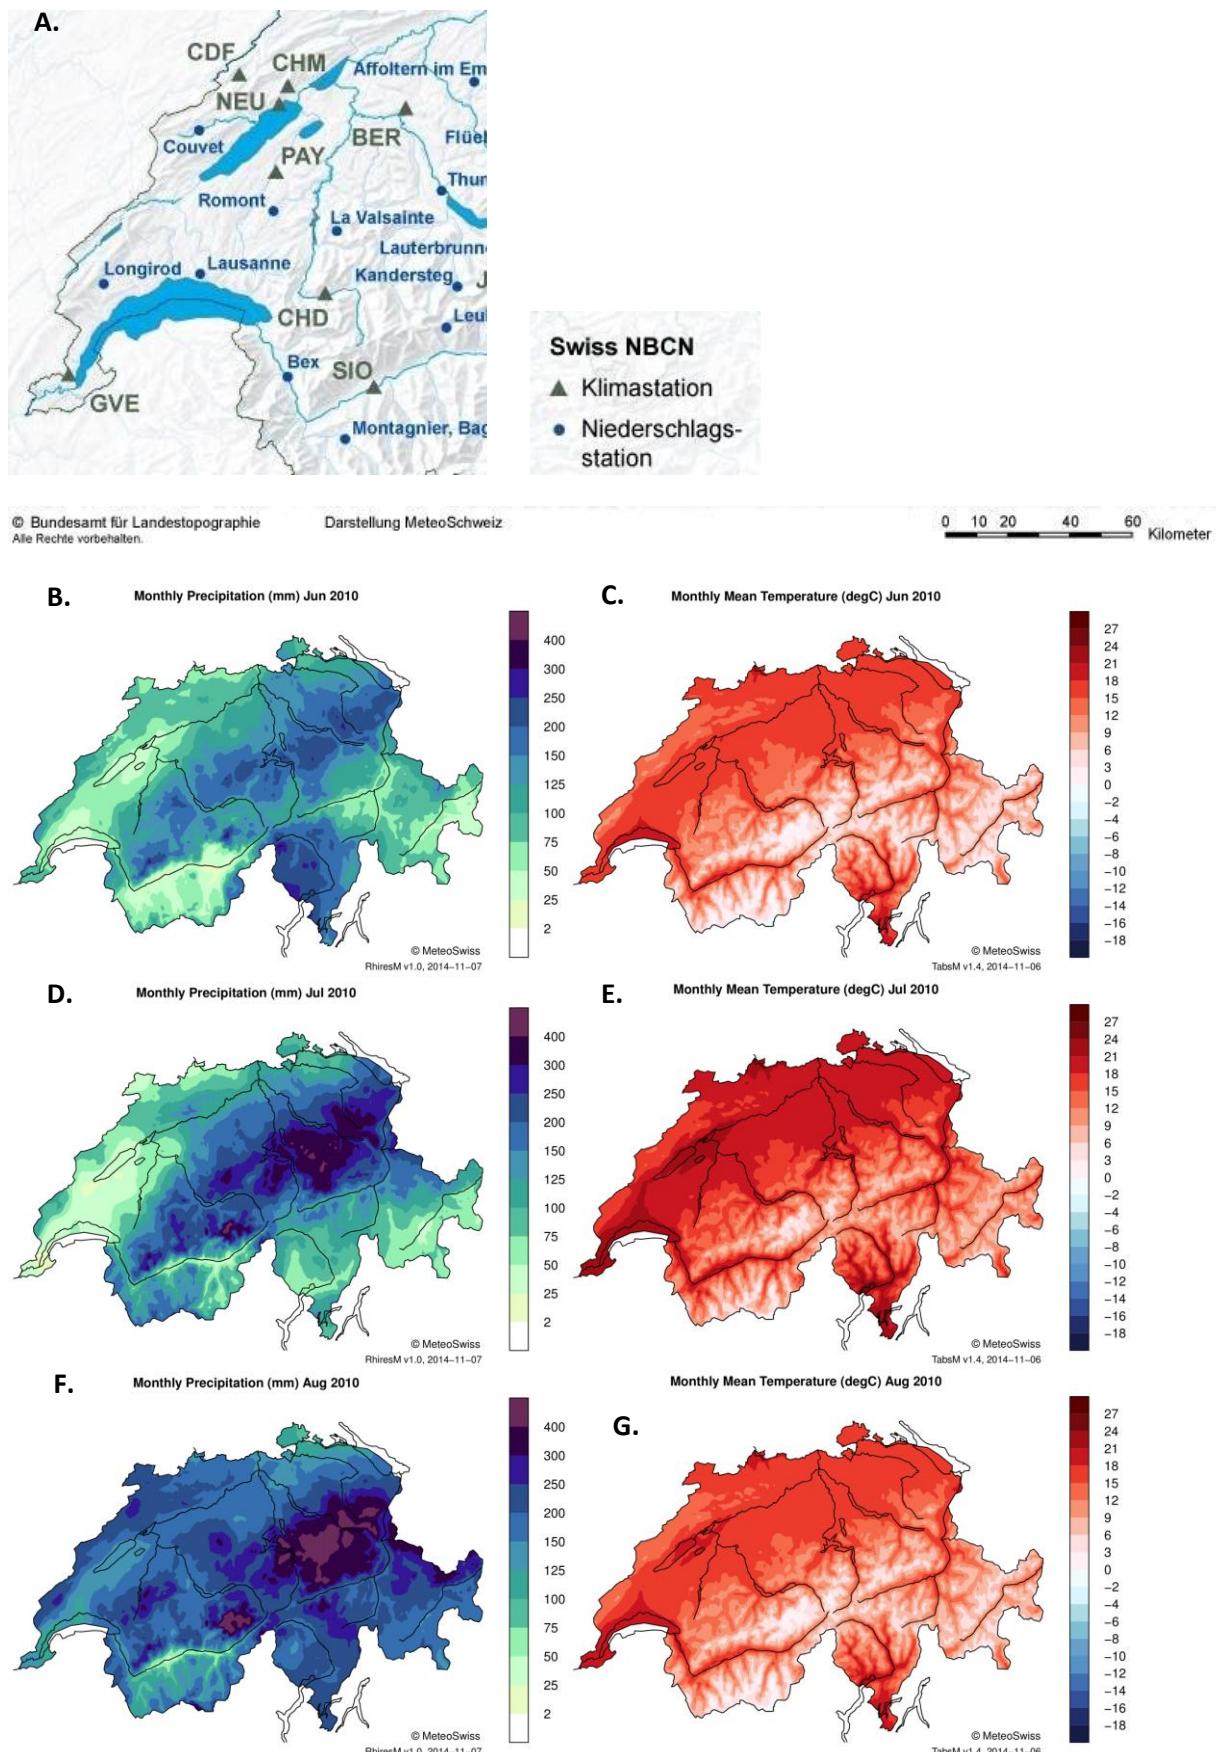

Table S1. Fields characteristics and fungicide treatments
