

Supplementary Table 6: Results of the model selection procedure to determine the most appropriate random effects structure for the size-at-age LMMs. Five different random effects structures were explored: 1 = unstratified residual variance (V_R) only; 2 = common (unstratified) random effect of family (V_{FAM}) + common V_R ; 3 = V_{FAM} stratified by group + common V_R ; 4 = common $V_{FAM} + V_R$ stratified by group; 5 = V_{FAM} and V_R each stratified by group. df = degrees of freedom associated with each random effects structure. The chosen random effects structure with the lowest Akaike Information Criterion (AIC) in each case is highlighted in bold.

Cohort	Sample	AIC for each random effects structure				
		1	2	3	4	5
