

SUPPLEMENTARY FIGURE

Supplementary Figure S1: Comparison of the bacterial load in gastric biopsies of NTx and d3Tx infected mice at 6 and 12 months post-infection. Results obtained by quantitative PCR. Grey bars represent the bacteria/murine cell ratio in NTx mice at 6 and 12 months post-infection ($n = 38$ and $n = 40$, respectively), white bars for data obtained in d3Tx ($n = 36$ and $n = 32$, respectively). Data are plotted as bar graphs displaying the mean \pm standard deviation for each group, $*p < 0.05$.
