**Table S3.** (a) Best GLMM models explaining individual virus prevalence in *A. mellifera* using AIC for model selection. \*Significant variables.  $r^2_c = 0.36; 0.36; 0.64$  and  $r^2_m = 0.15; 0.19; 0.38$  for BQCV, DWV and ABPV, respectively. (b) Best GLM model explaining total RNA virus prevalence in *A. mellifera*, using AICc for model selection (b). \*Significant variables. Nagelkerke  $r^2 = 0.59$
