

Supplementary Figure 1. Synthesis of alkyne macrocyclized peptides. The metathesis reaction was optimized using different resins and reaction conditions (Supplementary Table 1). A detailed overview of all synthesized peptides (sequences, analytical data) is shown in Supplementary Table 2 and Supplementary Table 3. j = number of C-terminal amino acids (2, 6); i = number of amino acids between the building blocks (2, 3, 6); k = number of N-terminal amino acids after the last building block (2, 4); n = 1, 2, 4; X = Fmoc, FITC

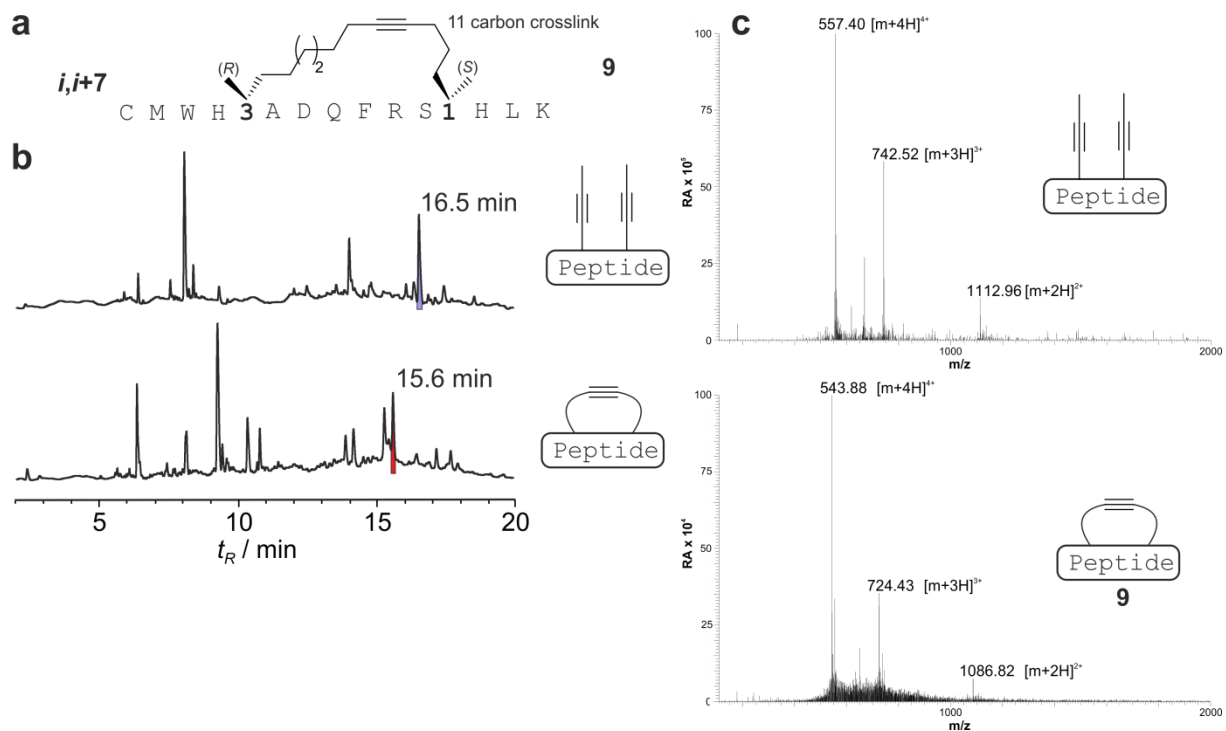

Supplementary Figure 2. (a) Sequence of the *i,i+3* macrocyclized peptide **7** containing N-terminal Cys and Met residues. (b) HPLC traces of **7** in the open- (top) and closed conformation (bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed (bottom) alkyne crosslink. The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

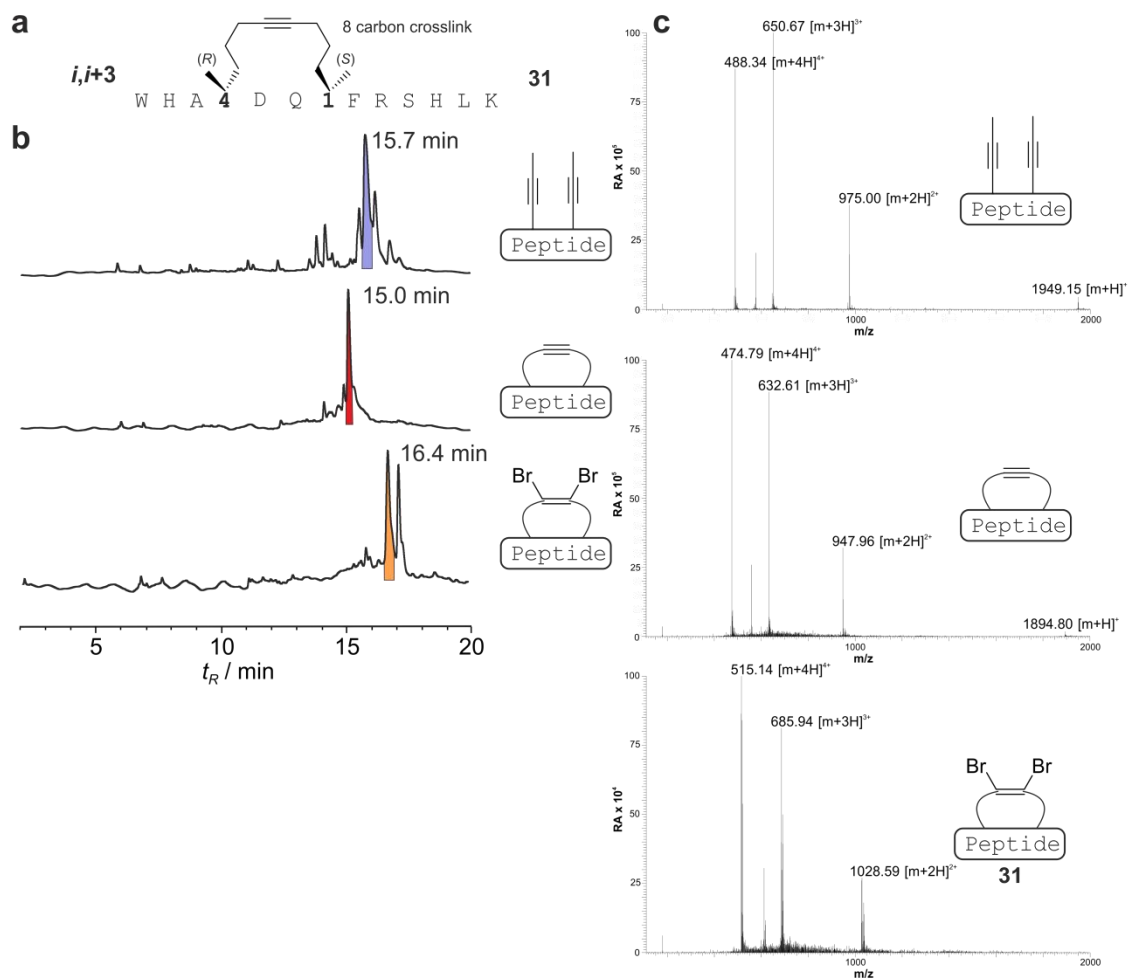

Supplementary Figure 3. (a) Sequence of the *i,i+4* macrocyclized test peptide **8** containing N-terminal Cys and Met residues. (b) HPLC traces of **8** in the open- (top) and closed conformation (bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed (bottom) alkyne crosslink. The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

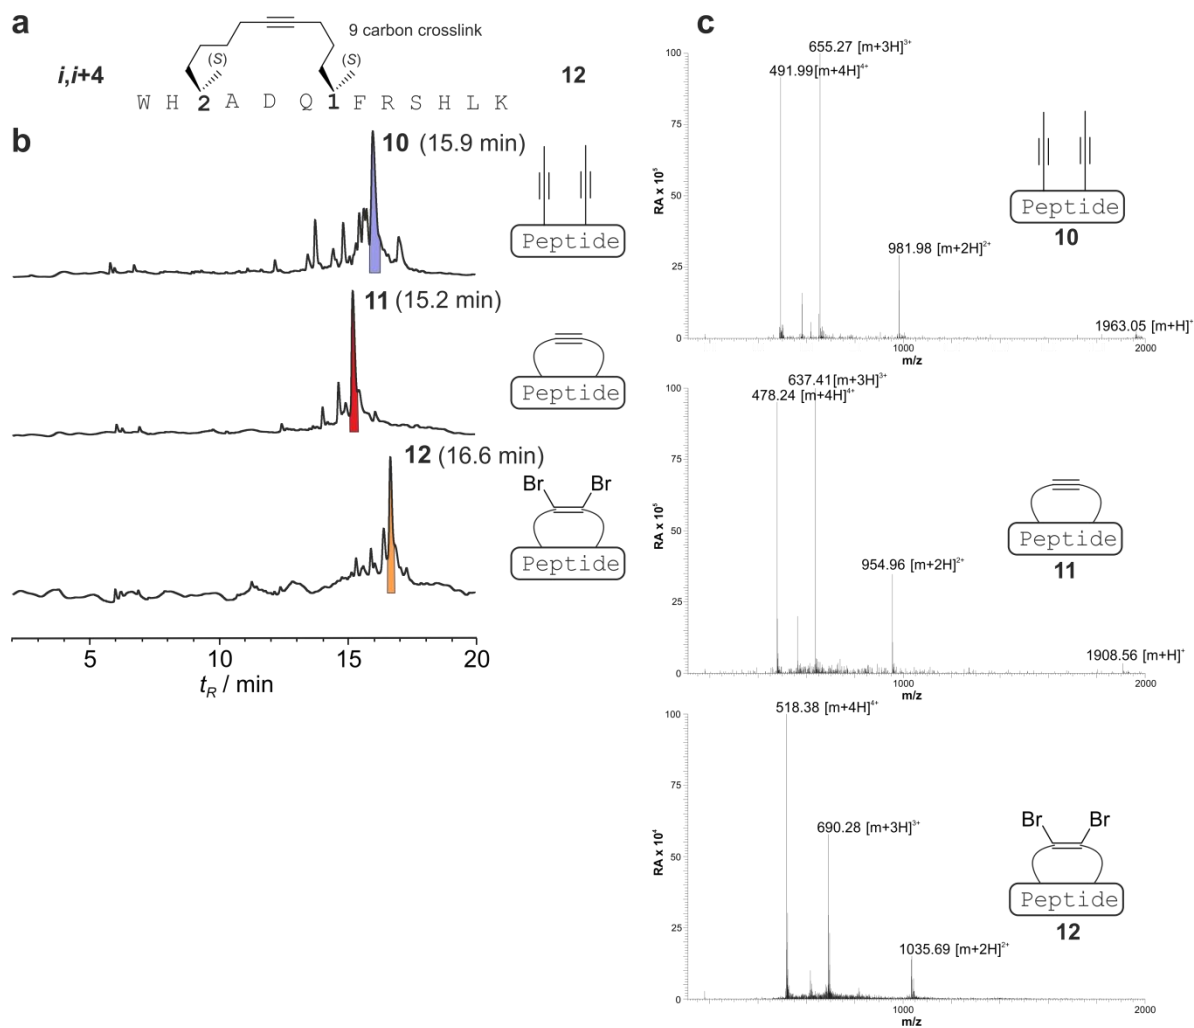

Supplementary Figure 4. (a) Sequence of the *i,i+4* macrocyclized test peptide **30** containing N-terminal Cys and Met residues. The reduced size of the macrocycle (8 carbon atoms) decreases metathesis efficacy. (b) HPLC traces of **30** in the open- (top) and closed conformation (bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed (bottom) alkyne crosslink. The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

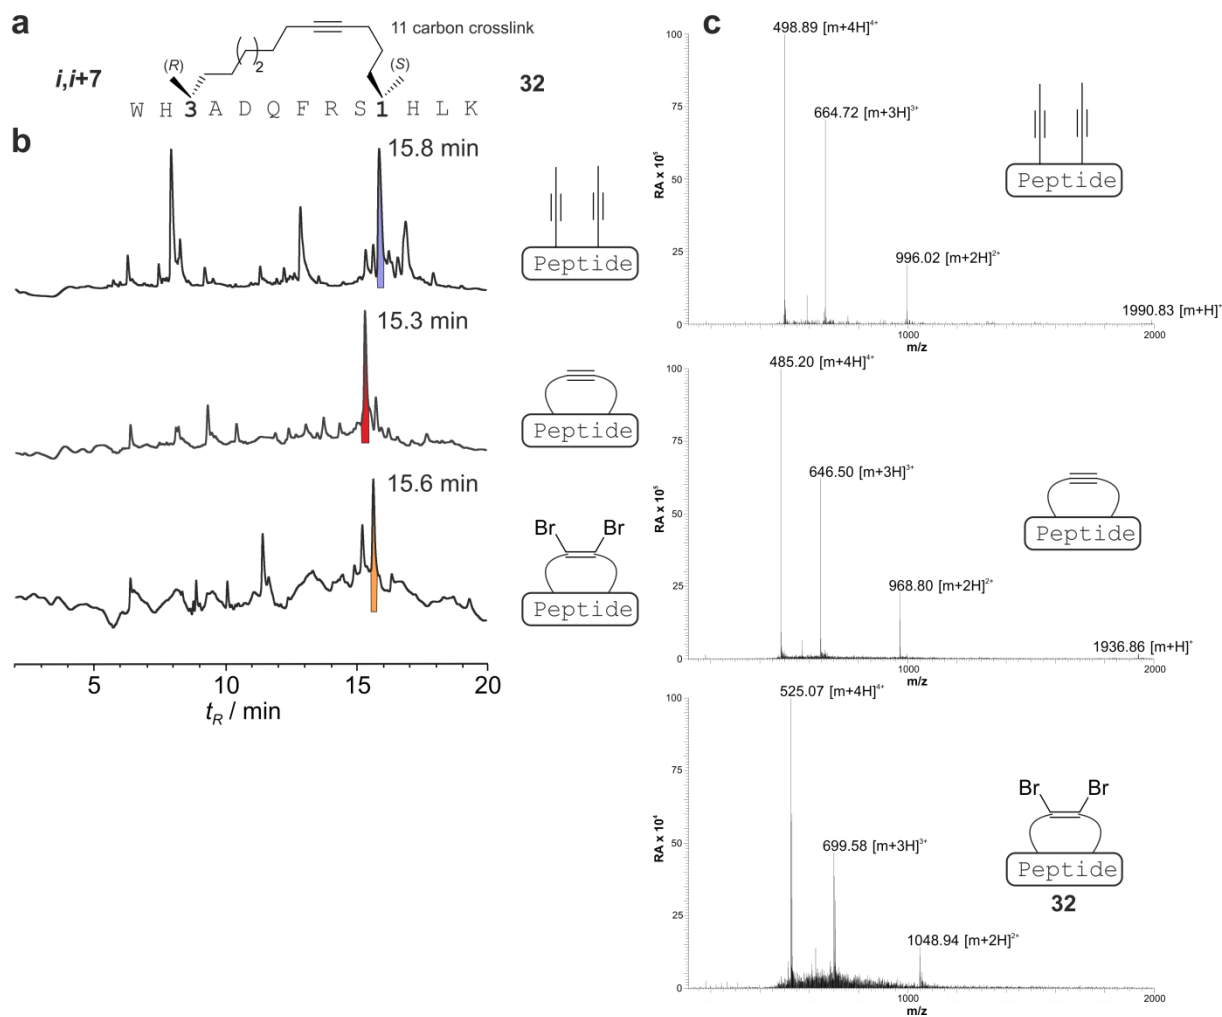

Supplementary Figure 5. (a) Sequence of the *i,i+7* macrocyclized test peptide **9** containing N-terminal Cys and Met residues. (b) HPLC traces of **9** in the open- (top) and closed conformation (bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed (bottom) alkyne crosslink. The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

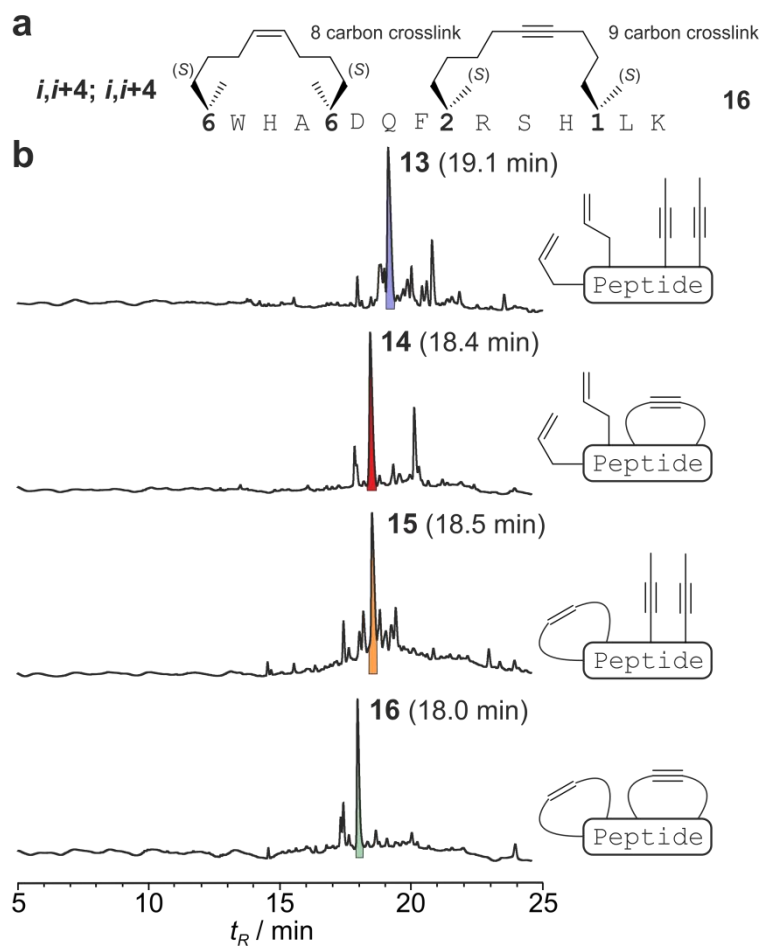

Supplementary Figure 6. (a) Sequence of the *i,i+3* macrocyclized test peptide **31** without the N-terminal Cys and Met residues. After RCAM the alkyne macrocycle is dibrominated using CuBr_2 . (b) HPLC traces of **31** in the open- (top), closed- (middle) and dibrominated conformation (bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed (middle) alkyne crosslink and the bibrominated olefin (bottom). The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

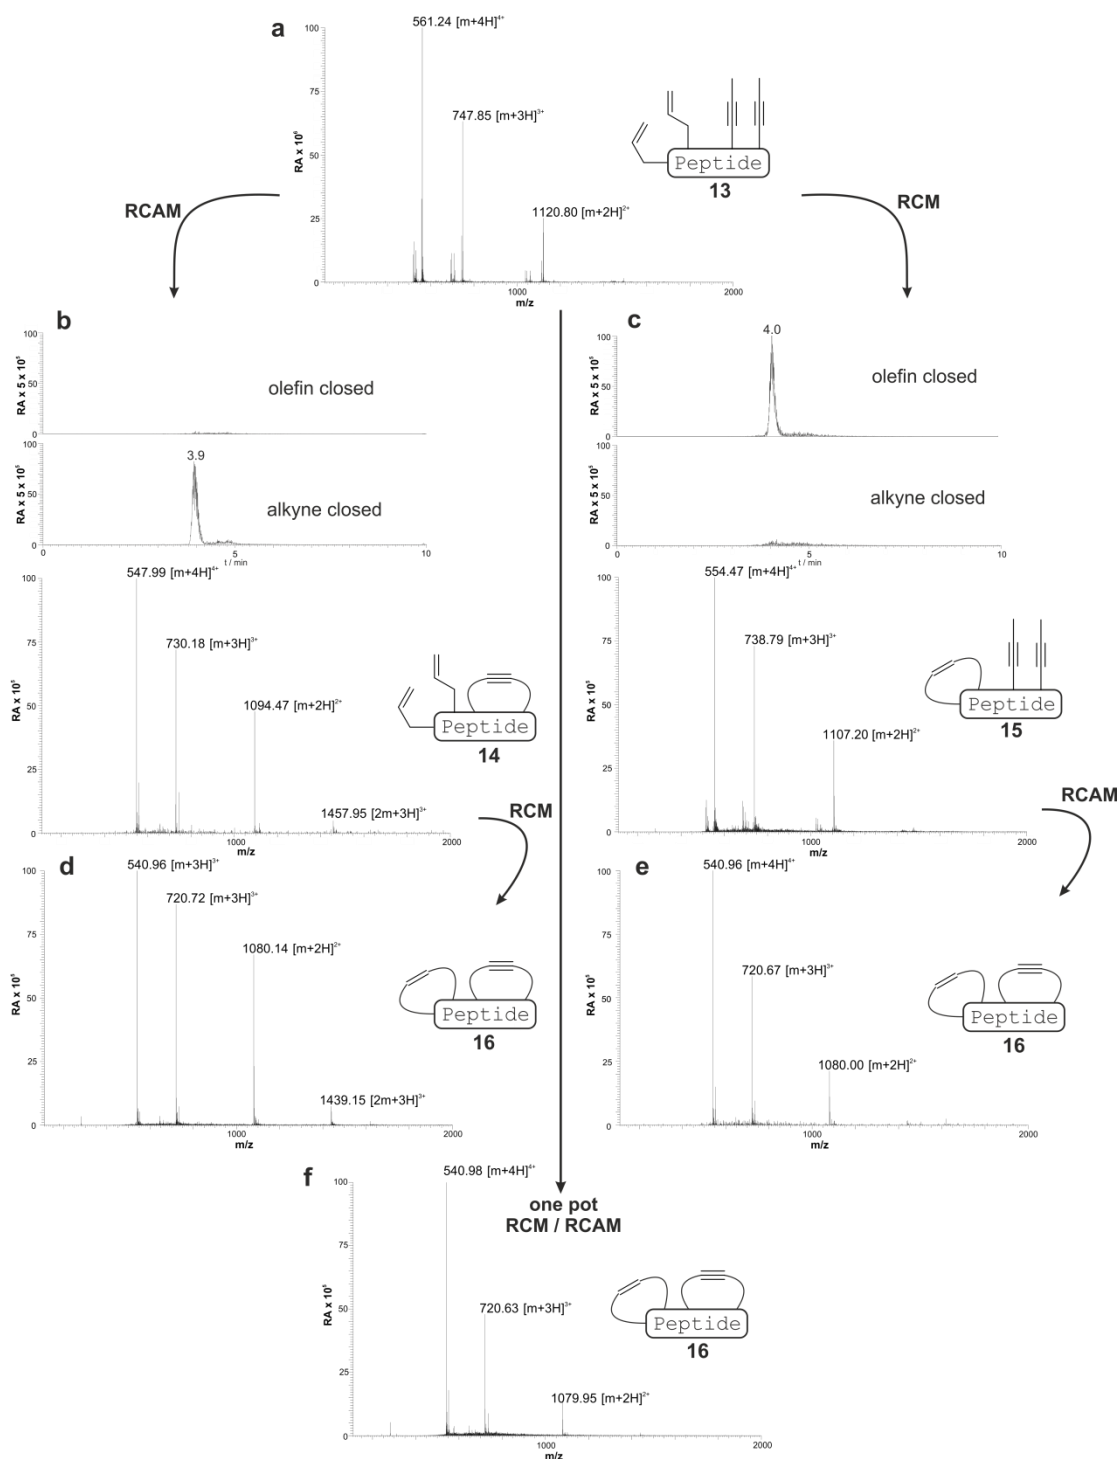

Supplementary Figure 7. (a) Sequence of the *i,i+4* macrocyclized test peptide **12** without the N-terminal Cys and Met residues. After RCAM the alkyne macrocycle is dibrominated using CuBr_2 . (b) HPLC traces of **12** in the open- (**10**, top), closed- (**11**, middle) and dibrominated conformation (**12**, bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed- (middle) alkyne crosslink and the dibrominated olefin (bottom). The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

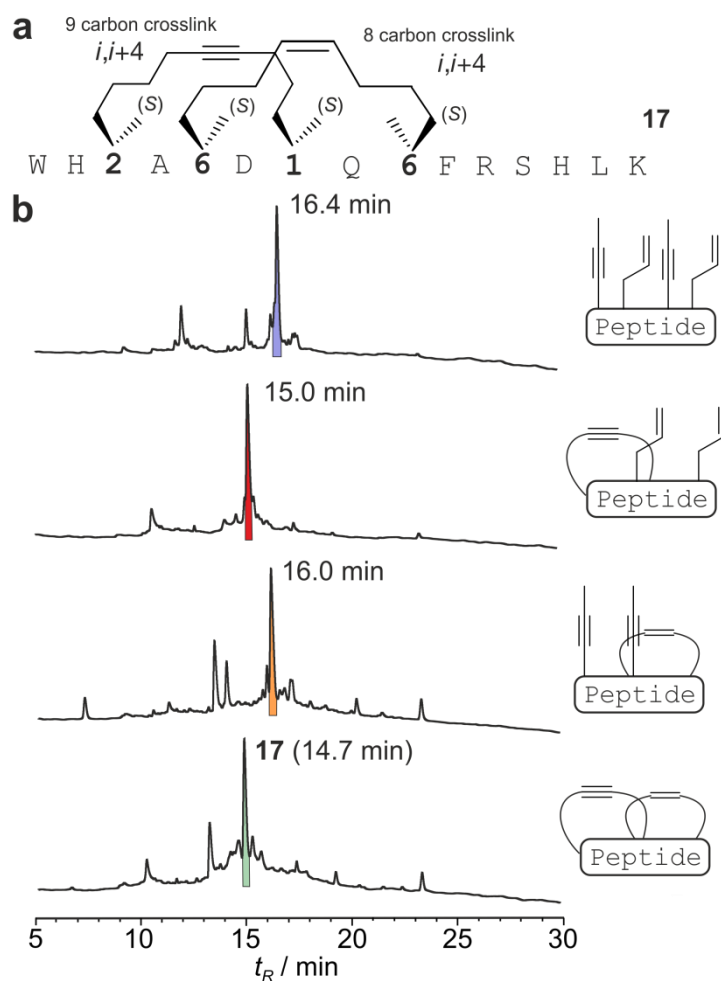

Supplementary Figure 8. (a) Sequence of the *i,i+7* macrocyclized test peptide **32** without the N-terminal Cys and Met residues. After RCAM the alkyne macrocycle is dibrominated using CuBr_2 . (b) HPLC traces of **32** in the open- (top), closed- (middle) and dibrominated conformation (bottom). The product peak is highlighted accordingly. (c) Mass spectra of the open- (top) and closed (middle) alkyne crosslink and the dibrominated olefin (bottom). The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

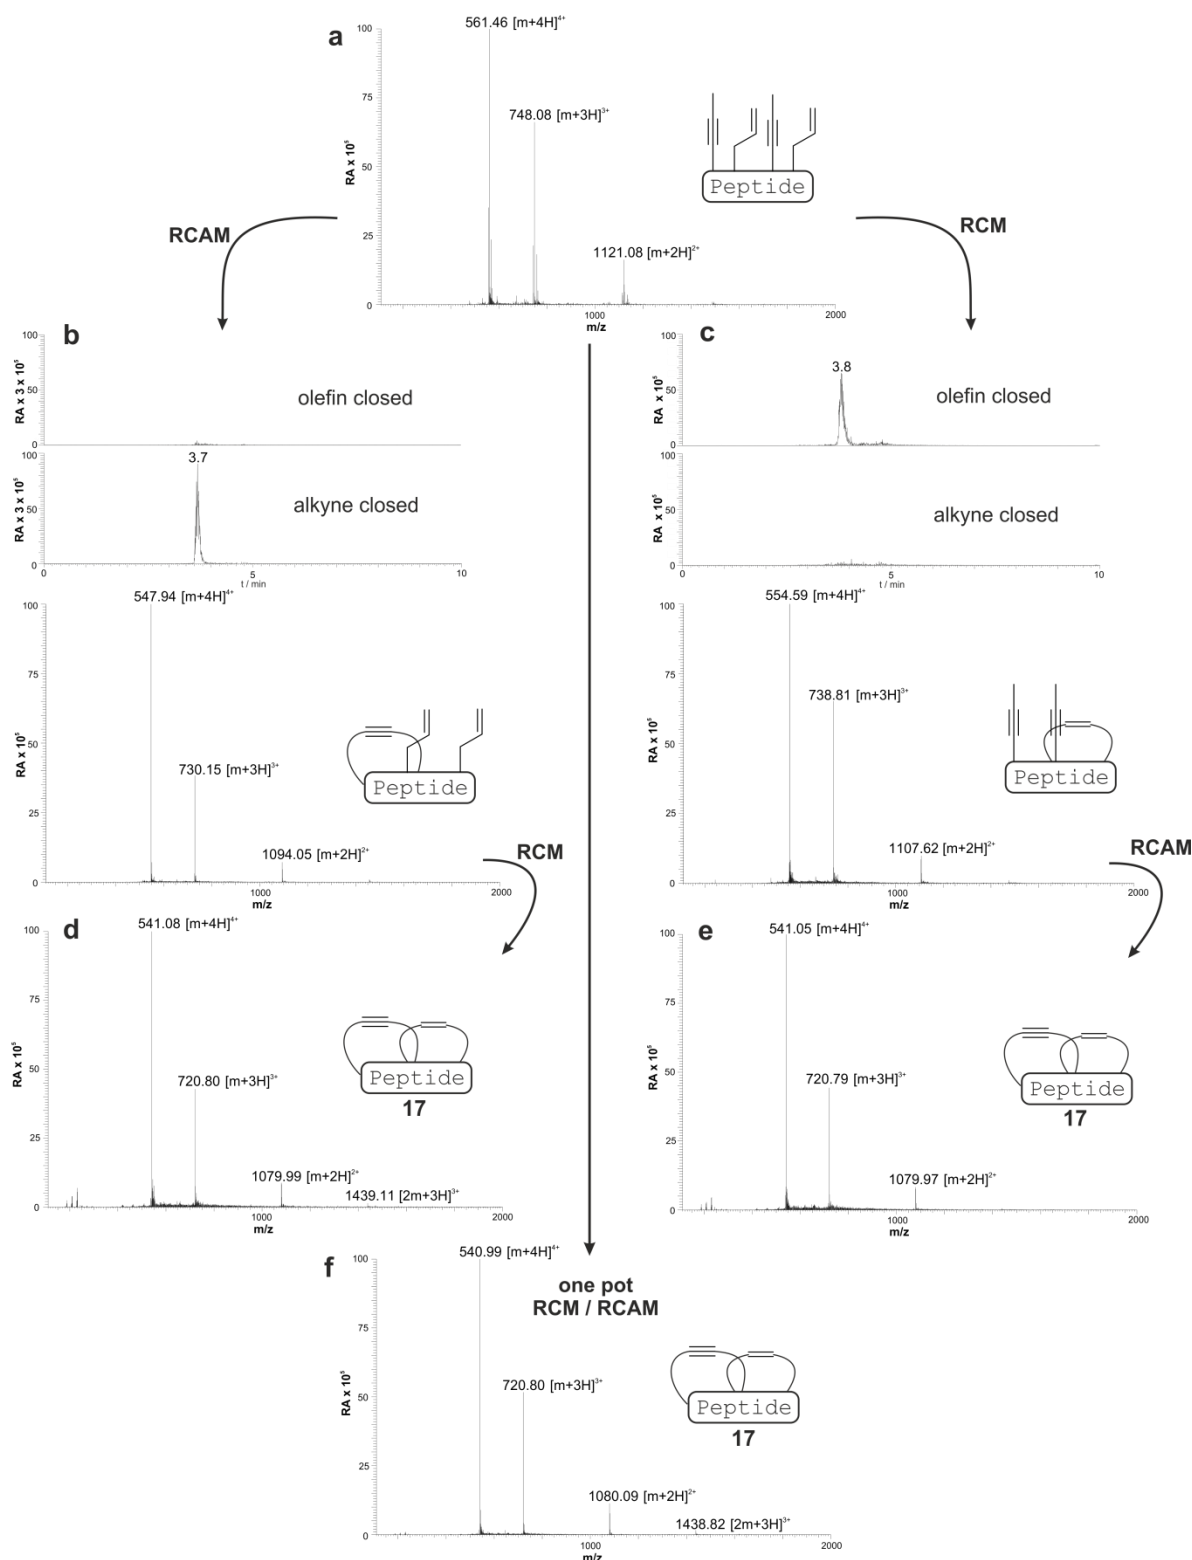

Supplementary Figure 9. (a) Sequence of the *i,i+4; i,i+4* bicyclic peptide **16** without the N-terminal Cys and Met residues. The olefin and alkyne macrocycle can be closed without affecting the orthogonal functionalities. (b) HPLC traces of **16** in the open- (**13**, top), alkyne-closed- (**14**, second), olefin-closed- (**15**, third) and fully closed conformation (**16**, bottom). The product peak is highlighted accordingly. The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

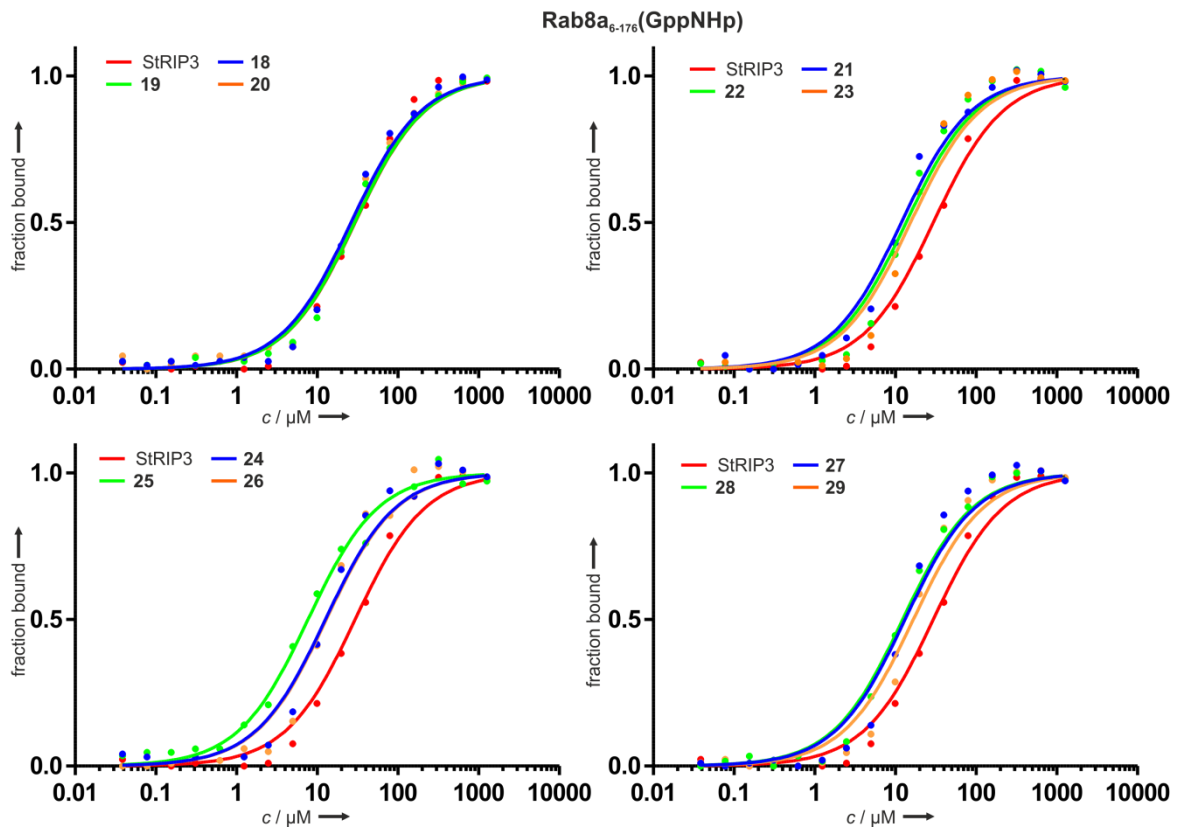

Supplementary Figure 10. Mass spectra of the *i,i*+4; *i,i*+4 bicyclic peptide **16**. (a) MS pattern of the fully open peptide precursor **13**. (b) HPLC-MS analysis of the alkyne macrocyclized intermediate (**14**, top). Only the alkyne macrocyclized intermediate and no olefin crosslinked intermediate can be detected. MS pattern of the alkyne macrocyclized intermediate (bottom). (c) HPLC-MS analysis of the olefin macrocyclized intermediate (**15**, top). Only the olefin macrocyclized intermediate and no alkyne crosslinked intermediate can be detected. MS pattern of the olefin macrocyclized intermediate (bottom). (d) MS pattern of the fully closed bicyclic alkyne/olefin peptide **16**. (e) MS pattern of the fully closed bicyclic olefin/alkyne peptide **16**. (f) MS pattern of the fully closed bicyclic one pot synthesis alkyne/olefin peptide **16**.

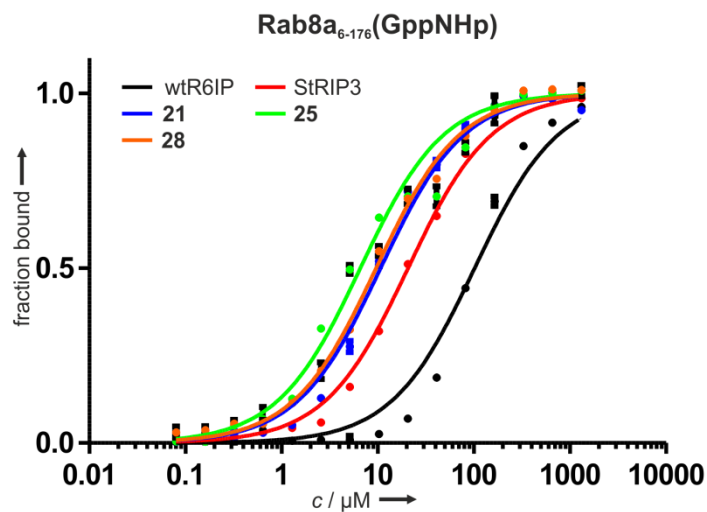

Supplementary Figure 11. (a) Sequence of bicyclic peptide **17** without the N-terminal Cys and Met residues. The olefin and alkyne macrocycle can be closed without affecting the orthogonal functionalities. (b) HPLC traces of **17** in the open- (top), alkyne-closed- (second), olefin-closed- (third)^[a] and fully closed conformation (**17**, bottom). The product peak is highlighted accordingly. [a] Grubbs 1st gen. catalyst (2 mg/mL), dry toluene, 40°C, 2 x 1.5 h. The HPLC chromatograms are taken from crude reaction mixtures without any further purification.

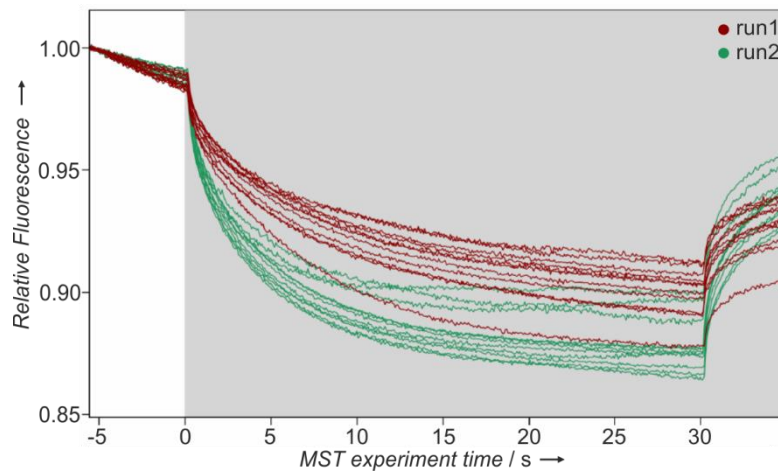

Supplementary Figure 12. Mass spectra of bicyclic peptide **17**. (a) MS pattern of the fully open peptide precursor. (b) HPLC-MS analysis of the alkyne macrocyclized intermediate (top). Only the alkyne macrocyclized intermediate and no olefin crosslinked intermediate can be detected. MS pattern of the alkyne macrocyclized intermediate (bottom). (c) HPLC-MS analysis of the olefin macrocyclized intermediate (top). Only the olefin macrocyclized intermediate and no alkyne crosslinked intermediate can be detected. MS pattern of the olefin macrocyclized intermediate (bottom). (d) MS pattern of the fully closed bicyclic alkyne/olefin peptide **17**. (e) MS pattern of the fully closed bicyclic olefin/alkyne peptide **17**. (f) MS pattern of the fully closed bicyclic one pot synthesis alkyne/olefin peptide **17**.

Supplementary Methods

Chemicals and instrumentation

Unless otherwise noted, chemicals were purchased from Sigma Aldrich, Merck, Okeanos, Roth or Alfa Aesar and were used without further purification. Protected Fmoc-amino acids and coupling reagents were purchased from Novabiochem and Iris Biotech GmbH. Building block **6** for hydrocarbon peptide stapling was purchased from Okeanos Tech. Co. LTD. All solvents were purchased from commercial suppliers and used without further purification. Analytical HPLC was performed using an Agilent 1100 Series with either a C18 HPLC column 3 μm (Macherey Nagel) or a C18 HPLC column 1.8 μm (Macherey Nagel). The system was run at a flow rate of 1.0 mL/min over 30 min using H₂O (0.1% TFA) and MeCN (0.1% TFA) as solvents. Linear gradients were run over varying periods of time. The efficiency of nucleotide exchange was monitored by analytical HPLC using 50 mM KH₂PO₄ (pH 7.0) and 10 mM TBABr and MeCN (0.1% TFA) as solvents. HPLC-MS analyses were performed with an Agilent 1100 Series connected to a Thermo LCQ Advantage mass spectrometer using a C18 HPLC column 3 μm (Macherey Nagel). The system was run at a flow rate of 1 mL/min over 15 min using H₂O (0.1% formic acid) and MeCN (0.1% formic acid) as eluents. Semi preparative HPLC was carried out on a Agilent 1100 Series using a SP125/10 Nuclear C18 Gravity 5 μm column (Macherey Nagel) at a flow rate of 6 mL/min. Linear gradients using H₂O (0.1% TFA) and MeCN (0.1% TFA) were run over varying periods of time. High resolution mass spectra were recorded on a QLT Orbitrap mass spectrometer coupled to an Acceka HPLC-System (HPLC column: Hypersyl GOLD, 50 mm x 1mm particle size 1.9 μm , ionization method: Electrospray Ionization). Automated Peptide synthesis was performed using a CEM-Discover microwave and a CEM-Liberty peptide synthesizer. Fluorescence polarization was measured with a Tecan Safire². Absorbance measurements were performed on a Tecan infinite M200 and Thermo scientific Nanodrop 2000c. ¹H- and ¹³C-NMR spectra were recorded on a Varian Mercury VX 500 or 400 spectrometer at room temperature. NMR spectra were calibrated to the solvent signals CDCl₃ (7.26 and 77.16) or DMSO (2.50 and 39.52). MicroScale Thermophoresis (MST) curves were measured on a NanoTemper Technologies Monolith NT.115.

Peptide synthesis

General

Peptides were synthesized on solid-phase using the Fmoc-strategy and Rink Amide (MBHA) resin, Rink Amide NovaSyn TGR resin or ChemMatrix Rink Amide resin as solid support. Solvents and soluble reagents were removed by suction. Washings between coupling and deprotection were carried out in DMF and DCM using 1 mL solvent per 100 mg resin. Coupling efficiency was monitored by ESI-MS and/or HPLC analyses.

Fmoc group deprotection

The resin was swollen in DMF and treated with a solution of piperidine/DMF (20/80, v/v) for 2 x 5 min. Afterwards the resin was washed with DMF (3x), DCM (3x) and DMF (3x).

Amino acid coupling

Fmoc-Xaa-OH (4 eq.) was dissolved in freshly prepared solution of HCTU (3.9 eq., 0.5 M) with DIEA (8 eq.). Subsequently, this mixture was added to the resin and shaken for 30 min at room temperature. For coupling of the Alkyne building blocks (**1 – 4**), the building block **6** and the subsequent amino acid: Fmoc-Xaa-OH (4 eq.) was dissolved in DMF in the presence of COMU (3.9 eq.), Oxyma (3.9 eq.) and DIEA (8 eq.), added to the resin and shaken for 1 h at room temperature. Except coupling of the Alkyne building blocks **1 – 4** and the alkene building block **6**, all couplings were performed as double couplings. All equivalents are calculated based on theoretical loading of the resin as provided by the vendor.

***N*-Acetylation**

For preparation of *N*-acetylated peptides and whenever a quantitative yield even after recoupling treatments was not achieved, the free *N*-terminal amino group was acetylated using a solution of Ac₂O/DIEA/DMF (1/1/8, v/v/v) for 2 x 10 min at room temperature.

Microwave peptide synthesis

Unmodified peptide sequences were synthesized with a microwave assisted peptide synthesizer. Removal of the Fmoc group was performed in piperidine/DMF (20/80, v/v), 1 min 30°C (intensity = 40 W) and 5 min 70 °C (intensity = 40 W). Coupling of amino acids was performed as double couplings in DMF, Fmoc-Xaa-OH (4 eq., 0.2 M), HCTU (3.9 eq., 0.5 M) and DIEA (8 eq., 0.2 M in NMP) for 10 min at 80°C (intensity = 20 W). Coupling of His- and Cys residues was performed as double couplings for 15 min at 60°C (intensity = 20 W).

Fluorescence labelling with FITC

Prior to fluorescence labelling with FITC a PEG-linker (Fmoc-O₂Oc-OH) was coupled to the free *N*-terminus. A mixture of Fmoc-O₂Oc-OH (5 eq.), COMU (4.9 eq.), Oxyma (4.9 eq.) and DIEA (10 eq.) in DMF was transferred to the resin and shaken at room temperature for 2 x 1 h. The resin was drained and washed with DMF (3x). The Fmoc

group was removed as described above and the resin was treated with FITC (5 eq.) and DIEA (10 eq.) for 16 h at room temperature under exclusion of light. Afterwards, the resin was washed with DMF (3x), DCM (3x) and dried to constant weight in vacuo.

Ring closing alkyne metathesis

The dried resin was transferred under argon into a baked out Schlenk tube and swollen and shrunken alternating in dry diethyl ether and dry toluene (3x each). Afterwards 0.5 mL of a solution of the alkyne metathesis complex **5** (2 mg mL^{-1}) in dry toluene was added and the reaction mixture was stirred at 40°C for 1.5 h. During the reaction time argon was bubbled through the reaction mixture to evaporate the 2-butyne. After addition of 0.5 mL of fresh complex **5** solution the mixture was stirred at 40°C for 1.5 h. The resin was filtered off, washed with toluene (3x), DCM (3x) and dried to constant weight.

Ring closing olefin metathesis

The dried resin was swollen in DCE for 15 min. A solution of Grubbs 1st generation catalyst (2 mg mL^{-1}) in DCE was added to the resin and reacted for 2 h at room temperature. During the reaction time argon was bubbled through the reaction mixture to remove ethene. The procedure was repeated twice and the resin was washed with DCE (3x), DCM (3x), DMF (3x).

One pot ring closing alkyne and olefin metathesis

The dried resin was transferred under argon into a baked out Schlenk tube and swollen and shrunken alternating in dry diethyl ether and dry toluene (3x each). Afterwards 0.5 mL of a solution of the alkyne metathesis complex **5** (2 mg mL^{-1}) and Grubbs 1st generation catalyst (2 mg mL^{-1}) in dry toluene was added and the reaction mixture stirred at 40°C for 1.5 h. During the reaction time argon was bubbled through the reaction mixture to evaporate the 2-butyne. After addition of 0.5 mL of fresh complex solution (alkyne complex **5** and Grubbs 1st generation catalyst) the mixture was stirred at 40°C for 1.5 h. The resin was filtered off, washed with toluene (3x), DCM (3x) and dried to constant weight.

Dibromination of alkyne macrocycles

The dried resin was swollen in dry MeCN for 15 min and treated with a mixture of CuBr_2 in dry MeCN (2 mg mL^{-1}) for 2 h. The reaction was performed in a Syringe

reactor and the procedure was repeated twice. Afterwards, the resin was washed with MeCN (3x), DMF (3x), DCM (3x).

Cleavage from the resin

The dry resin was treated with a solution of TFA/EDT/TIS/H₂O (94/1/2.5/2.5, v/v/v/v) 100 μ L 10 mg⁻¹ resin for 2 x 1 h and 1 x 5 min. The solvents were evaporated and the crude peptide was precipitated by the addition of cold diethyl ether. After centrifugation (10 min, 16.100 x g, 4°C) the supernatant was removed. The crude product was dissolved in H₂O/MeCN (2/1, v/v) and lyophilized. The crude peptides were purified by semi-preparative HPLC.

Fmoc quantification

A defined amount of dry resin was transferred into an Eppendorf cap and treated with 0.5 mL deprotection solution for 15 min. The UV absorption of the supernatant was determined at 305 nm and the occupation density calculated using Beer-Lambert law ($\epsilon = 7800 \text{ cm}^{-1} \text{ M}^{-1}$).

Peptide quantification

The concentration of fluorescein labeled peptides was determined by UV absorption in 20 mM phosphate buffer (pH 8.5) at 496 nm ($\epsilon = 77.000 \text{ cm}^{-1} \text{ M}^{-1}$). The concentration of acetylated peptides was determined gravimetrically or via UV absorption at 280 nm.

Biochemical methods

Protein expression and purification

Expression and purification of Rab8a₆₋₁₇₆ was performed analog to full-length Rab8a according to established protocols.^{1,2}

Nucleotide exchange

Nucleotide exchange was performed according to previously established protocols.^{2,3} Briefly, for nucleotide removal Mg²⁺ was removed by addition of a 5-fold excess of EDTA and reacted for 1 h at room temperature. The protein solution was desalted

using a PD-10 desalting column Sephadex G-25 DNA Grade (GE Healthcare) with elution buffer consisting of 20 mM HEPES (pH 7.5), 50 mM NaCl, 1 mM TCEP. After removal of Mg^{2+} the protein was diluted to 80 - 100 μM before addition of $ZnCl_2$ (500 μM) and $(NH_4)_2SO_4$ (200 mM). After addition of alkaline phosphatase (5 U mg^{-1} Rab protein) the mixture was incubated for 16 h at 4°C. For nucleotide exchange, the mixture contained a 5-fold excess of GppNHp during alkaline phosphatase incubation. Afterwards, the mixture was desalted using a PD-10 desalting column Sephadex G-25 DNA Grade (GE Healthcare) with elution buffer consisting of 25 mM HEPES (pH 7.5) 150 mM NaCl, 1 mM TCEP, 1 mM $MgCl_2$ and 1 μM GppNHp.

Fluorescence polarization assay for the determination of dissociation constants K_d

Rab8a₆₋₁₇₆ was serially diluted in a buffer containing 25 mM HEPES (pH 7.5), 150 mM NaCl, 1 mM $MgCl_2$, 1 mM TCEP, 0.01% tween 20 and 1 μM GppNHp (assay buffer), treated with 66 nM fluorescein-labeled peptides and incubated for 4 h at room temperature. Binding assays were performed in 384-well, small volume, black flat-bottom, non-binding plates (Greiner). Fluorescence polarization values ($\lambda_{ex} = 470$ nm, $\lambda_{em} = 525$ nm) were determined using a Safire II plate reader (Tecan) at room temperature. Initial studies for alkyne macrocyclized peptides were performed as single measurements. Final affinity measurements of a subset of peptides were performed in triplicates. After correction for changes in fluorescence intensity upon binding, the fluorescence anisotropy data were converted into fraction bound (Supplementary equation 1) of the FITC- labeled peptide and fitted to a one-site binding model derived from the law of mass action using K_d as the only fitting parameter (Supplementary equation 2).⁴ In case of incomplete binding due to the limited solubility of Rab proteins, anisotropy top-values were extrapolated and constrained as indicated below. Non-linear regression was performed in Prism 5.0 (Graphpad).⁵

$$fraction\ bound = \frac{A - A_{free}}{A - A_{free} + Q(A_{bound} - A)} \quad (\text{Supplementary equation 1})$$

A: observed anisotropy; A_{free} : anisotropy of free fluorophore; A_{bound} : anisotropy of bound fluorophore; Q: change in fluorescence intensity between free and bound state

$$fraction\ bound = \frac{K_d + L_T + c_{Rab} - \sqrt{(K_d + L_T + c_{Rab})^2 - 4L_T c_{Rab}}}{2L_T} \quad (\text{Supplementary equation 2})$$

K_d : dissociation constant; L_T : total concentration of labeled peptide; c_{Rab} : protein concentration

Microscale Thermophoresis (MST)

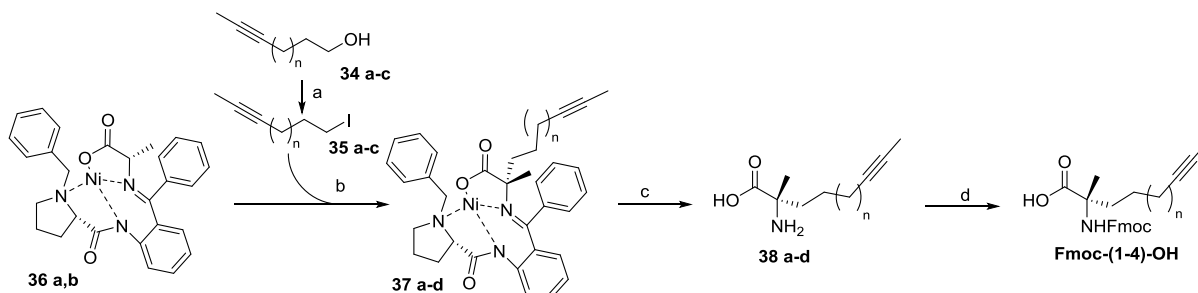

Rab8a₆₋₁₇₆ (GppNHp) was serially diluted in assay buffer and treated with 133 nM fluorescein-labeled peptide. After incubation for 4 h at room temperature the mixture was soaked into capillaries for microscale thermophoresis (MST) measurements. K_d values were calculated after initial fluorescence analysis of the obtained MST curves using the software Monolith Affinity Analysis (NanoTemper Technologies).

Competition fluorescence polarization assay

Acetylated peptides were serially diluted in assay buffer (1:1) and were incubated with a mixture of 60 nm fluorescein-labeled peptide and Rab8a₆₋₁₇₆ (GppNHp) (15 μ M or 100 μ M depending on K_d of the labeled peptide) for 1 h at room temperature. Fluorescence polarization was determined and half maximal inhibitory concentrations (IC_{50}) were calculated by nonlinear regression analysis of dose-response curves using Prism 5.0 software (GraphPad).⁵

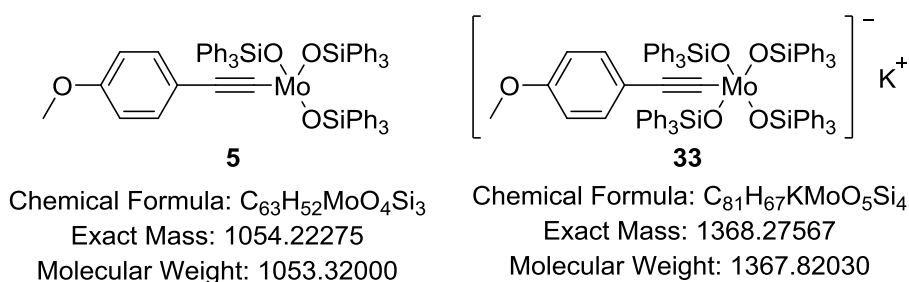

Synthetic methods

Synthesis of the alkyne building blocks **1-4** was performed according to adapted protocols from *Y. N. Belokon et al.*⁶ and *G. H. Bird et al.*⁷ Schematic representation of the synthesis is summarized below.

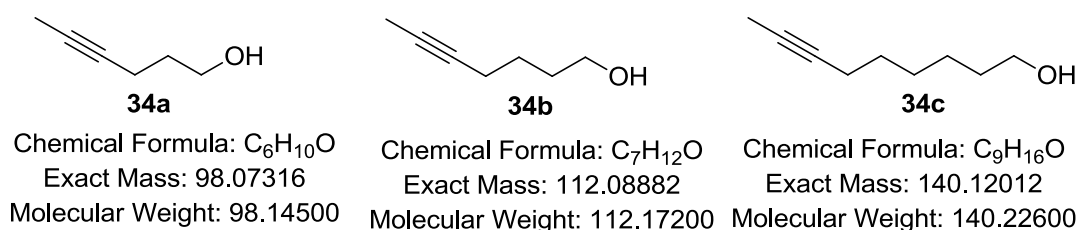

Synthesis of the alkyne building blocks. (a) PPh_3 , I_2 , Imidazol; THF, room temperature, 2 h; (b) KOH, 24 a-c; DMF, 0°C – room temperature, 2 h; (c) HCl, MeOH, reflux, 1 h; (d) Fmoc-OSu, Na_2CO_3 , Dioxane/ H_2O (1/1, v/v), room temperature, 7d. $n = 1, 2, 4$

Synthesis of Mo-complexes **5** and **33**

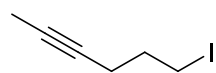

Mo-complexes for RCAM **5** and **33** were prepared according to previously established procedures.⁸

Synthesis of alkyne alcohols (**34a-c**)

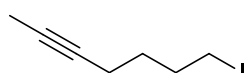

Synthesis of alkyne alcohols hex-4-yn-1-ol (**34a**), hept-5-yn-1-ol (**34b**) and non-7-yn-1-ol (**34c**), was carried out according to previously established protocols.⁹

Synthesis of iodo-alkynes (35a-c)

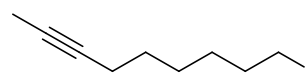

35a

Chemical Formula: C₆H₉I
Exact Mass: 207.97489
Molecular Weight: 208.04247

35b

Chemical Formula: C₇H₁₁I
Exact Mass: 221.99054
Molecular Weight: 222.06947

35c

Chemical Formula: C₉H₁₅I
Exact Mass: 250.02184
Molecular Weight: 250.12347

The alcohol **34a-c** was converted into the iodo-alkynes 6-iodohex-2-yne (**35a**), 7-iodohept-2-yne (**35b**) and 9-iodonon-2-yne (**35c**) following established protocols.¹⁰

35a

¹H NMR (500 MHz, CDCl₃): δ = 3.30 (t, J = 6.8 Hz, 2H), 2.29 – 2.23 (m, 2H), 1.95 (p, J = 6.7 Hz, 2H), 1.77 (t, J = 2.6 Hz, 3H). ¹³C NMR (126 MHz, CDCl₃): δ = 77.4, 77.1, 32.7, 19.9, 5.8, 3.6.

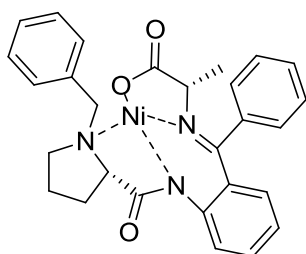

35b

¹H NMR (500 MHz, CDCl₃): δ = 3.20 (t, J = 7.0 Hz, 2H), 2.19 – 2.13 (m, 2H), 1.98 – 1.88 (m, 2H), 1.77 (t, J = 2.6 Hz, 3H), 1.62 – 1.52 (m, 2H). ¹³C NMR (126 MHz, CDCl₃): δ = 78.5, 76.3, 32.7, 29.9, 17.9, 6.5, 3.6.

35c

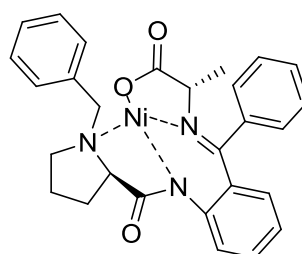

¹H NMR (500 MHz, CDCl₃): δ = 3.19 (t, J = 7.0 Hz, 2H), 2.16 – 2.08 (m, 2H), 1.87 – 1.79 (m, 2H), 1.77 (t, J = 2.5 Hz, 3H), 1.51 – 1.44 (m, 2H), 1.43 – 1.36 (m, 4H). ¹³C NMR (126 MHz, CDCl₃): δ = 79.2, 75.7, 33.6, 30.2, 28.9, 27.9, 18.8, 7.2, 3.6.

Synthesis of (S, R)-Ala-Ni(II)-BPB (36a,b)

36a

Chemical Formula: C₂₈H₂₇N₃NiO₃
Exact Mass: 511.14059
Molecular Weight: 512.22568

36b

Chemical Formula: C₂₈H₂₇N₃NiO₃
Exact Mass: 511.14059
Molecular Weight: 512.23540

Synthesis of the Ni-complexes **36a** and **36b** was carried out according to previously established protocols starting either from *L*- or *D*-Proline.^{6,7,11}

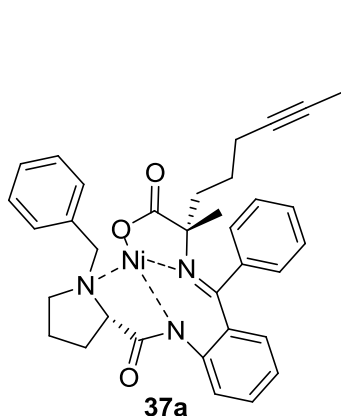

36a:

¹H NMR (400 MHz, DMSO) δ = 8.4 (d, J = 7.5 Hz, 2H), 8.0 (d, J = 8.7 Hz, 1H), 7.6 – 7.5 (m, 4H), 7.4 (t, J = 7.7 Hz, 2H), 7.2 – 7.1 (m, 2H), 7.1 – 7.0 (m, 1H), 6.7 – 6.6 (m, 1H), 6.5 (dd, J = 8.2, 1.5 Hz, 1H), 4.1 (d, J = 12.3 Hz, 1H), 3.7 – 3.4 (m, 4H), 3.4 – 3.3 (m, 1H), 2.5 – 2.4 (m, 2H), 2.3 – 2.1 (m, 2H), 1.4 (d, J = 7.0 Hz, 3H). **¹³C NMR** (101 MHz, DMSO): δ = 180.9, 179.0, 142.9, 135.5, 134.2, 133.2, 132.1, 131.9, 130.2, 129.6, 129.5, 129.2, 129.0, 128.3, 128.0, 126.4, 124.0, 120.7, 70.3, 66.6, 63.2, 58.2, 31.1, 24.4, 22.0. **HRMS**: calc. [m+H]⁺ for C₂₈H₂₇N₃NiO₃ = 512.14787; found = 512.14789 [m+H]⁺. **HPLC** (flow rate 1 mL/min, 10-90% MeCN (0.1% TFA), 13 min) = 7.93 min.

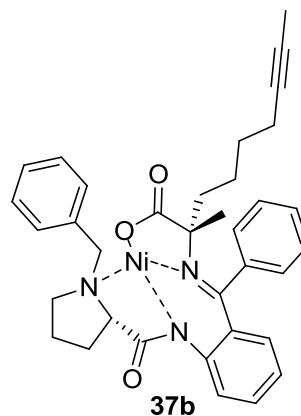

36b:

¹H NMR (600 MHz, DMSO) δ = 8.33 (d, J = 8.1 Hz, 2H), 7.93 (d, J = 8.7 Hz, 1H), 7.60 – 7.52 (m, 2H), 7.48 (m, 2H), 7.35 (dd, J = 10.8, 4.7 Hz, 2H), 7.13 (m, 2H), 7.05 (m, 1H), 6.64 (m, 1H), 6.49 (dd, J = 8.2, 1.6 Hz, 1H), 4.03 (d, J = 12.4 Hz, 1H), 3.58 – 3.47 (m, 4H), 3.35 – 3.30 (m, 1H), 2.47 – 2.38 (m, 2H), 2.23 – 2.10 (m, 2H), 1.42 (d, J = 7.1 Hz, 3H). **¹³C NMR** (101 MHz, DMSO): δ = 180.2, 178.3, 169.4, 142.2, 134.7, 133.5, 132.5, 131.4, 131.6, 129.5, 128.9, 128.8, 128.5, 128.3, 127.6, 127.3, 125.7, 123.3, 120.0, 69.6, 65.9, 62.5, 57.5, 30.4, 23.7, 21.3. **HRMS**: calc. [m+H]⁺ for C₂₈H₂₇N₃NiO₃ = 512.14787; found = 512.14810 [m+H]⁺. **HPLC** (flow rate 1 mL/min, 10-90% MeCN (0.1% TFA), 13 min) = 8.12 min.

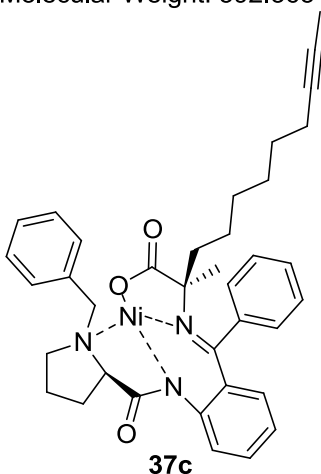

Synthesis of alkynated (S),(R)-Ala-Ni(II)-BPB (37a-d)

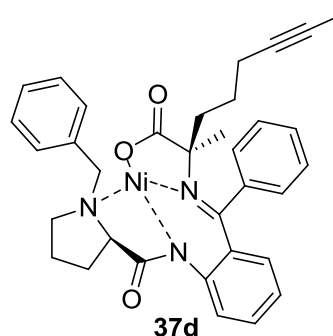

Chemical Formula: $C_{34}H_{35}N_3NiO_3$
Exact Mass: 591.20319
Molecular Weight: 592.36540

Chemical Formula: $C_{35}H_{37}N_3NiO_3$
Exact Mass: 605.21884
Molecular Weight: 606.39240

Chemical Formula: $C_{37}H_{41}N_3NiO_3$
Exact Mass: 633.25014
Molecular Weight: 634.43314

Chemical Formula: $C_{34}H_{35}N_3NiO_3$
Exact Mass: 591.20319
Molecular Weight: 592.35340

To a solution of **36a,b** in 15 mL DMF in a baked out flask under argon, freshly ground KOH (5.0 eq.) was added and the reaction mixture stirred for 20 min at 0°C. After addition of iodo-alkynes (**30a-c**) (1.2 eq.) in 2 mL DMF, the mixture was stirred for 20 min at 0°C and another 2 h at room temperature. The reaction was quenched by pouring it onto chilled acetic acid (125 mL, 5%) and extracted with DCM (3 × 80 mL). The combined organic layers were washed with water (50 mL), brine and dried over MgSO₄. After co-evaporation with toluene the pure product was obtained as a red solid. Yields: **37a** = 98%; **37b** = 98%; **37c** = 99%; **37d** = 95%.

37a:

¹H NMR (500 MHz, DMSO) δ = 8.33 (d, J = 7.1 Hz, 2H), 7.92 – 7.86 (m, 1H), 7.54 – 7.47 (m, 3H), 7.46 – 7.38 (m, 3H), 7.24 (t, J = 7.5 Hz, 1H), 7.15 (d, J = 7.6 Hz, 1H), 7.11 – 7.04 (m, 1H), 6.68 – 6.61 (m, 1H), 6.57 (dd, J = 8.4, 1.5 Hz, 1H), 4.10 – 4.06 (m, 1H), 3.68 (d, J = 12.4 Hz, 1H), 3.52 (t, J = 8.3 Hz, 1H), 3.42 – 3.35 (m, 1H), 3.09 – 2.98 (m, 1H), 2.64 – 2.54 (m, 1H), 2.48 – 2.41 (m, 2H), 2.26 – 2.19 (m, 2H), 2.18 –

Synthesis of unprotected α-methyl-α-alkynyl amino acids (38a-d)

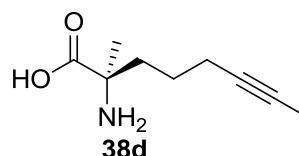

Chemical Formula: C₉H₁₅NO₂
Exact Mass: 169.11028
Molecular Weight: 169.22400

Chemical Formula: C₁₀H₁₇NO₂
Exact Mass: 183.12593
Molecular Weight: 183.25100

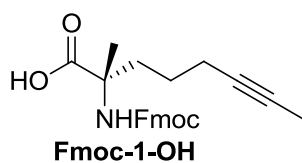

Chemical Formula: C₁₂H₂₁NO₂
Exact Mass: 211.15723
Molecular Weight: 211.30064

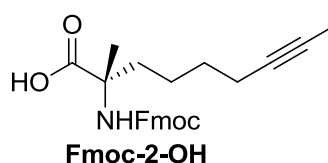

Chemical Formula: C₉H₁₅NO₂
Exact Mass: 169.11028
Molecular Weight: 169.22090

To a solution of **37a-d** in MeOH (40 mL), conc. hydrochloric acid (10 eq.) was added and the reaction mixture refluxed at 80 °C for 1 h. The reaction mixture was allowed to cool to room temperature and concentrated *in vacuo*. After addition of 20 mL water (20 mL) the aqueous layer was extracted with DCM (3 × 20 mL). The combined organic layers were washed with brine, dried over MgSO₄ and concentrated under reduced pressure. Recovered BPB was purified by precipitation as hydrochloric salt from acetone solution.¹² The aqueous layer was dried by lyophilization and the crude unprotected α-methyl-α-alkynyl amino acid was used without any further purification.

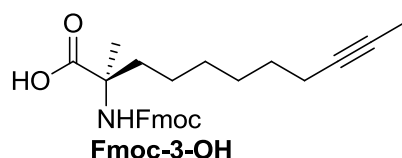

Synthesis of Fmoc-protected α -methyl- α -alkynyl amino acids (1-4)

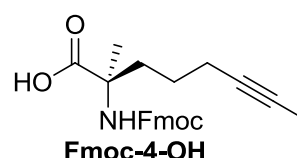

Chemical Formula: C₂₄H₂₅NO₄
Exact Mass: 391.17836
Molecular Weight: 391.46700

Chemical Formula: C₂₅H₂₇NO₄
Exact Mass: 405.19401
Molecular Weight: 405.49400

Chemical Formula: C₂₇H₃₁NO₄
Exact Mass: 433.22531
Molecular Weight: 433.53934

Chemical Formula: C₂₄H₂₅NO₄
Exact Mass: 391.17836
Molecular Weight: 391.45960

To a solution of the crude unprotected α -methyl- α -alkynyl amino acid in H₂O/dioxane (40 mL, 1/1, v/v), Na₂CO₃ (4 eq.) and Fmoc-OSu (1.2 eq.) were added and stirred at room temperature for 7 d. The reaction was monitored using HPLC-MS analysis, daily and subsequently fresh Fmoc-Osu (0.5 eq.) was added. After addition of water (100 mL) the pH of the aqueous layer was set to 2-4 using aqueous hydrochloric acid and the aqueous layer was extracted with ethylacetate (3 x 100 mL). The combined organic layers were washed with brine, dried over MgSO₄ and concentrated under reduced pressure. The crude product was purified via column chromatography (R_f = 0.45, PE:EA 1:1; 0.1% AcOH) and obtained as a pale yellow solid. Yields: **1a** = 98%; **2b** = 97%; **3c** = 86%; **4d** = 90%.

Fmoc-1-OH

¹H NMR (500 MHz, DMSO) δ = 12.38 (s, 1H), 7.89 (d, J = 7.5 Hz, 2H), 7.71 (d, J = 7.4 Hz, 2H), 7.43 (s, 1H), 7.41 (d, J = 7.3 Hz, 2H), 7.33 (t, J = 7.4 Hz, 2H), 4.31 – 4.22 (m, 2H), 4.22 – 4.16 (m, 1H), 2.14 – 2.01 (m, 2H), 1.88 – 1.79 (m, 1H), 1.79 – 1.73 (m, 1H), 1.72 (s, 3H), 1.45 – 1.33 (m, 2H), 1.32 (s, 3H). **¹³C NMR** (126 MHz, DMSO) δ = 175.2, 154.6, 143.8, 140.7, 127.6, 127.0, 125.2, 120.0, 79.1, 75.8, 65.2, 58.1, 46.7, 36.0, 23.3, 22.5, 18.3, 3.1. **HRMS**: calc. [m+H]⁺ for C₂₄H₂₆NO₄ = 392.18563 ; found = 392.18459 [m+H]⁺, 414.16581 [m+Na]⁺. **HPLC**: (flow rate 1 mL/min, 10-90% MeCN (0.1% TFA), 13 min) = 9.73 min.

Fmoc-2-OH

¹H NMR (500 MHz, DMSO) δ = 12.37 (s, 1H), 7.89 (d, J = 7.5 Hz, 2H), 7.72 (d, J = 7.4 Hz, 2H), 7.42 (d, J = 7.4 Hz, 2H), 7.36 (d, J = 16.1 Hz, 1H), 7.33 (t, J = 7.4 Hz,

2H), 4.34 – 4.22 (m, 2H), 4.22 – 4.18 (m, 1H), 2.17 – 2.03 (m, 2H), 1.76 (s, 1H), 1.69 (t, J = 2.4 Hz, 3H), 1.68 – 1.59 (m, 1H), 1.45 – 1.35 (m, 2H), 1.33 (s, 3H), 1.30 – 1.19 (m, 2H). **¹³C NMR** (126 MHz, DMSO) δ = 175.3, 154.7, 143.8, 140.7, 127.6, 127.0, 125.2, 120.0, 79.1, 75.7, 65.2, 58.2, 46.7, 36.2, 28.7, 22.6, 22.4, 18.0, 3.1. **HRMS**: calc. [m+H]⁺ for C₂₅H₂₈NO₄ = 406.20128 ; found = 406.20119 [m+H]⁺, 428.18273 [m+Na]⁺. **HPLC**: (flow rate 1 mL/min, 10-90% MeCN (0.1% TFA), 13 min) = 10.12 min.

Fmoc-3-OH

¹H NMR (500 MHz, DMSO) δ = 12.32 (s, 1H), 7.89 (d, J = 7.5 Hz, 2H), 7.72 (d, J = 7.4 Hz, 2H), 7.41 (t, J = 7.4 Hz, 2H), 7.37 (s, 1H), 7.35 – 7.30 (m, 2H), 4.32 – 4.22 (m, 2H), 4.22 – 4.17 (m, 1H), 2.11 – 2.03 (m, 2H), 1.75 (s, 1H), 1.71 (t, J = 2.4 Hz, 3H), 1.69 – 1.61 (m, 1H), 1.43 – 1.35 (m, 2H), 1.33 (s, 3H), 1.25 (s, 2H), 1.23 (m, 4H). **¹³C NMR** (126 MHz, DMSO) δ = 175.4, 154.7, 143.8, 140.7, 127.6, 127.0, 125.2, 120.0, 79.3, 75.6, 65.2, 58.3, 46.7, 36.6, 28.7, 28.4, 28.1, 23.1, 22.3, 18.0, 3.1. **HRMS**: calc. [m+H]⁺ for C₂₇H₃₁NO₄ = 434.23258 ; found = 434.23458 [m+H]⁺, 456.21638 [m+Na]⁺. **HPLC**: (flow rate 1 mL/min, 10-90% MeCN (0.1% TFA), 11 min) = 7.18 min.

Fmoc-4-OH

¹H NMR (500 MHz, DMSO) δ = 12.37 (s, 1H), 7.89 (d, J = 7.5 Hz, 2H), 7.72 (d, J = 7.4 Hz, 2H), 7.43 (s, 1H), 7.42 (t, J = 7.6 Hz, 2H), 7.33 (t, J = 7.4 Hz, 2H), 4.29 – 4.22 (m, 2H), 4.22 – 4.17 (m, 1H), 2.14 – 2.01 (m, 2H), 1.89 – 1.79 (m, 1H), 1.76 (s, J = 11.9 Hz, 1H), 1.72 (s, 3H), 1.43 – 1.34 (m, 2H), 1.32 (s, 3H). **¹³C NMR** (126 MHz, DMSO) δ = 175.2, 154.7, 143.8, 140.7, 127.6, 127.0, 125.3, 120.0, 79.0, 75.9, 65.2, 58.1, 46.7, 36.0, 23.2, 22.4, 18.3, 3.1. **HRMS**: calc. [m+H]⁺ for C₂₄H₂₆NO₄ = 392.18563 ; found = 392.18504 [m+H]⁺, 414.16645 [m+Na]⁺. **HPLC**: (flow rate 1 mL/min, 10-90% MeCN (0.1% TFA), 13 min) = 9.60 min.
