

Supplementary Figure. CORT elevation in trunk blood after acute (3 hr) restraint stress in PACAP- and PAC1-deficient mice and wild-type male mice.

CORT elevation after 3 hour restraint is PACAP- as well as PAC1-dependent in mice when blood obtained by decapitation. Results are expressed as mean \pm SEM (n = 9-10 per group). Two-way ANOVA followed by Bonferroni's post hoc test. Bonferroni's test: ***p < 0.001; ns, not significant.
