

Supplementary Table 3. IPA upstream analysis

	Putative genes, molecules and drugs that could be responsible for changes in gene expression. Genes with FDR ≤ 0.05 (from Supplementary Table 1) were analyzed using QIAGEN's Ingenuity® Pathway Analysis. A positive z-score indicates that the regulator, if active, could be responsible for gene changes. Negative z-scores indicate that expression changes are in the opposite direction observed when this molecule is active. Absolute z-score ≥ 1.75 shown. Listed by z-score.				
	P-value of overlap is based on number genes differentially expressed that are also in the list of target genes regardless of direction.
