

A) All-cause mortality

B) Cardiovascular mortality

C) Respiratory mortality

eFigure 4. Percent change in all-cause mortality (A), cardiovascular mortality (B), and respiratory mortality (C) per IQR increase in chemical components of PM_{2.5} at single-day lags from 0 to 3, adjusted for ambient temperature, relative humidity, Ox, NO₂, and PM_{2.5} mass.

EC, elemental carbon; IQR, interquartile range; NO₂, nitrogen dioxide; OC, organic carbon; Ox, photochemical oxidants; PM_{2.5}, fine particulate matter.
