* Delivered Drug: The drug patient received in error.

† Intended Drug: The drug patient was supposed to receive.

‡ Average Harm Score: Represents the average of Round 3 evaluations of the opinion-generated estimate of the harm that might occur from this substitution, where patient received the delivered drug instead of the intended drug.

§ Number of Subjects: Represents the number of subjects in the 2000-2009 data who received both drugs in the respective LASA pair within a six month period, regardless of whether this was intended or in error. Each occurrence represents a potential LASA substitution error.

BOLD typeface indicates that the LASA pair is in the highest decile for potential harm for receiving the delivered drug in error and the highest decile for potential harm of not receiving the intended drug.

Italic typeface indicates brand names.

Appendix Table 2: 608 Published LASA pairs, Ranked by Potential Harm of NOT Receiving the Intended Drug as Assessed by Delphi Panel Participants.
