### Supplementary Figure S1. Genomic structure (A) and deduced amino acid sequence (B) of the *OsZFAND3* gene

A: horizontal lines and boxes indicate introns and exons in genomic structure, respectively. The locations of the three SNPs are marked with arrows. B: nucleotides (top) are numbered from 5' to 3', starting from the initiator codon (ATG), while amino acid residues (bottom) are numbered starting with the first methionine (M) residue. The asterisk (\*) indicates the stop codon (TGA). A20-like zinc finger region and Serine-rich region are boxed and underline, respectively.

The locations of the three SNPs are marked with arrows. B: nucleotides (top) are numbered from 5' to 3', starting from the initiator codon (ATG), while amino acid residues (bottom) are numbered starting with the first methionine (M) residue. The asterisk (\*) indicates the stop codon (TGA). A20-like zinc finger region and Serine-rich region are boxed and underline, respectively.

**Supplementary Figure S2. An unrooted phylogenetic tree of the ZFAND3 gene**

The phylogenetic tree was inferred by using the Neighbor-Joining method with whole deduced amino acid sequences. The values at the forks are Neighbor-Joining bootstrap supporting data. For the branch length, the distance given in the scale represents 0.05 amino acid substitution/site.

**Supplementary Table S1**

**Summary of genotypes of parents and their F<sub>1</sub> progenies of tilapia at SNP1, SNP2, SNP3, Onil\_1-89, Onil\_19-15 and Onil\_27-3 reported in this study (Please online Supplementary Dataset).**

**Supplementary Table S2**  
**Amino acid identities (%) of the ZFAND3 gene between hybrid tilapia and other representative species**

Gene	GenBank Accession No.	Amino acid	Identity	P-value
<i>Oreochromis niloticus</i>	XP_005447615.1	204	99%	2e-149
<i>Neolamprologus brichardi</i>	XP_006779955.1	238	93%	5e-123
<i>Haplochromis burtoni</i>	XP_005934639.1	238	93%	2e-122
<i>Cynoglossus semilaevis</i>	XP_008309070.1	254	69%	5e-96
<i>Homo sapiens</i>	NP_068762.1	227	52%	2e-58
