

## Supplementary Figure 1

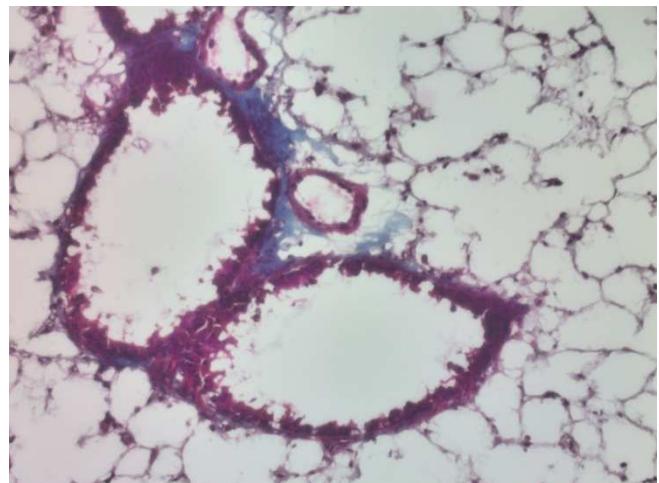

## Supplementary Figure 2

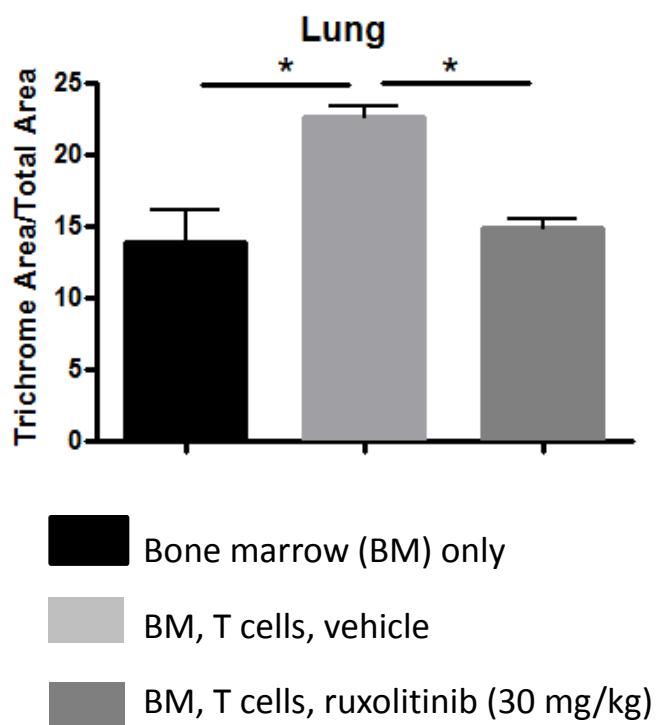

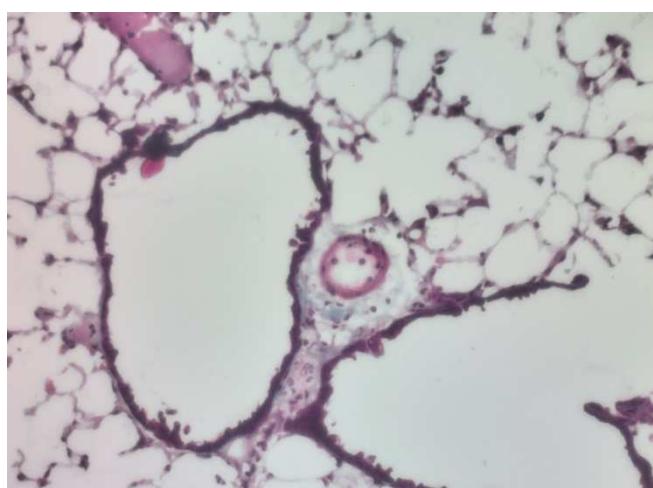

BM only

BM + T cells + vehicle

BM + T cells + ruxolitinib

## **Supplementary material and Figure legends**

### **Suppl. Figure 1:**

C57B/6 T-cell-depleted bone marrow with (BM+T) or without (BM Only) 85,000 purified C57B/6 T cells was injected to conditioned B10.BR recipient mice. From day 28-56, cGVHD mice were treated with 30mg/kg Ruxolitinib or vehicle. Day 60 pulmonary function test was taken on anesthetized animals. Animals (n=6) were artificially ventilated. Resistance, Elastance and Compliance were measured as indicators of pulmonary function.

### **Suppl. Figure 2:**

Histological analysis of the lungs of mice treated as described for Suppl. Figure 1 is shown. The trichrome positive area represents collagen deposition as a stigmata of chronic pulmonary GVHD. Representative images from the 3 groups and a quantification of the trichrome positive area are shown.

**Supplementary Table 1: Acute GvHD group - Transplant characteristics**

Donor	Chemotherapy conditioning	IS as prophylaxis	IS initiated as GvHD treatment prior to Ruxolitinib (duration in weeks)
