

Figure S6. Distribution of thymic subsets after genotoxic insult. **(A)** A representative staining profile of WT and *Trib2*^{-/-} thymus ($n = 9$ per genotype per studied time point) after 4 and 14 days of 5-FU treatment (250 mg/kg, i.p.) were shown here. The values indicated in the outlined areas are frequency of each thymic subset and graphed in **(B,C)**. **(D)** c-Kit expression of WT and *Trib2*^{-/-}DN1 thymocytes at steady state ($n = 7-8$ per genotype) and after 5-FU treatment (250 mg/kg, i.p.; $n = 4-6$ per genotype per studied time point) were shown in overlaid histograms. All quantified data are presented as mean and SEM.
