

Supplementary Figure 1. Parasite burdens of WT, CatL^{-/-}, CatS^{-/-} and AEP^{-/-} mice

WT, CatS^{-/-}, CatL^{-/-} and AEP^{-/-} mice were subcutaneously inoculated with 3×10^6 stationary phase promastigotes of *L. major* in the footpads and experimental read-outs were measured at indicated time-points. Logarithm base 10 of limit dilution for parasite burden from footpads of infected mice. Data are presented as mean+SD. n=3-7 mice per group/timepoint.
