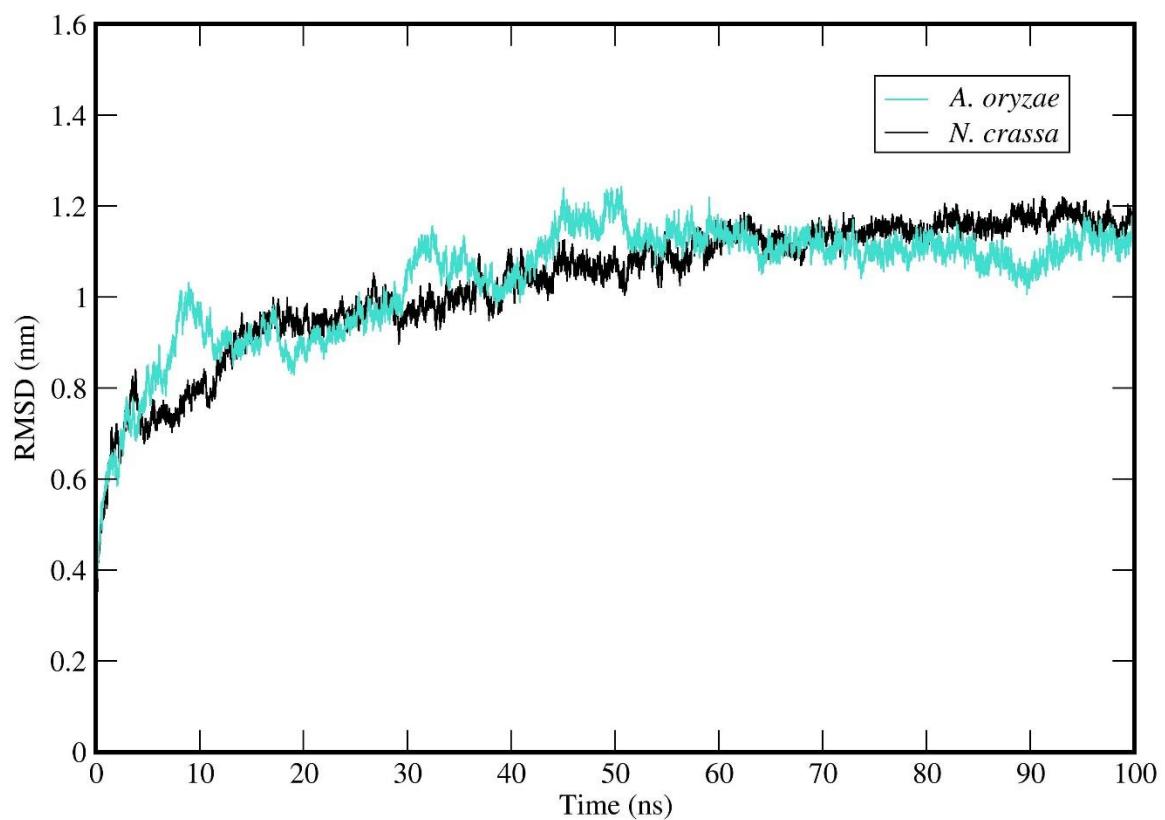

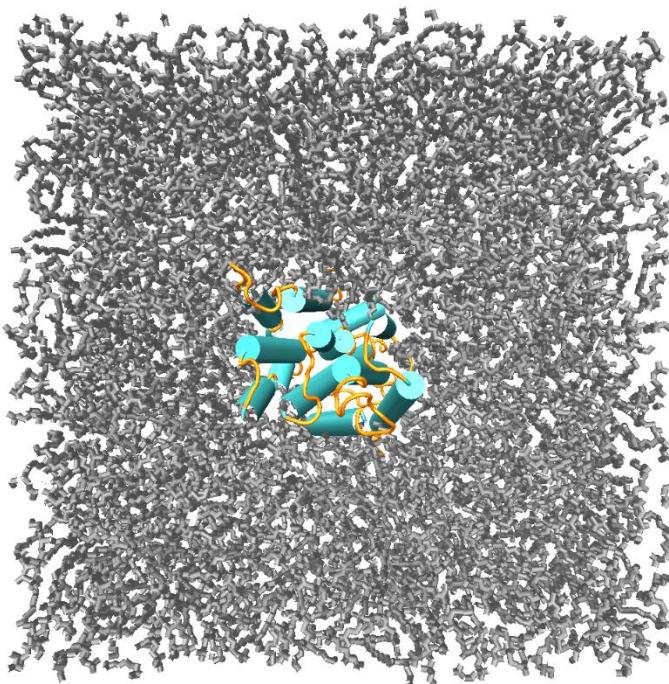

Figure S4. Initial snapshot of the MD simulation of M-domain of *A. oryzae* H⁺-ATPase integrated in palmitoyl oleoylphosphatidylcholine (POPC) lipid bilayer

Note: The simulation system consisted of 349 residues of the protein, 477 POPC lipids, 55,570 water molecules and 2 potassium ions. The total number of atoms was 194,970 in the system with box dimensions of 12.86 x 12.86 x 14.98 nm³. The temperature of the system was maintained at 298 K. Protein helices are shown in cyan and loops in orange. POPC is drawn as grey spheres. Water and ions are omitted for clarity.
