INVENTORY OF SUPPLEMENTAL MATERIAL

Supplementary Figure S1 Fibroblast-specific stabilization of β -catenin

Supplementary Table S1 Differentially regulated genes

Supplementary Figure S1. Fibroblast-specific stabilization of β -catenin (a) Gating strategy for quantifying different subpopulations of tdTomato⁺ cells in Figure 3b. Representative plots are shown. (b) Specificity of Dlk1CreER^{T2} tdTomato lineage tracing in Figure 5b. ITGA6⁻/LIN⁻/CD31⁻ cells were gated as in (b). Representative plots show that recombination occurs in Dlk1⁺ fibroblasts but not in epidermal, endothelial or hematopoietic cells. (c-f) Immunofluorescent staining for β -catenin, tdTomato and DAPI (c, e). (d, f) show the β -catenin channel of images in (c, e). (g, h) Relative expression of the indicated genes in flow-sorted tdTomato⁺ fibroblasts isolated from P4 back skin (g) and flow-sorted tdTomato⁺/Sca1⁻ and tdTomato⁺/Sca1⁺ fibroblasts isolated from P56 back skin. Data show means \pm SEM (n=3-4 biological samples pooled from 2-4 animals). * p \leq 0.05 compared to Sca1⁺ control fibroblasts; ## p \leq 0.005 compared to Sca1⁻ control fibroblasts. (i, j) H&E stained sections of back skin of P90 mice of the genotypes indicated. Note that the hair follicles are in telogen, even though there is an evident reduction in the adipocyte layers on expression of stabilized β -catenin via Pdgfr α CreER^{T2}. Scale bars: 200 μ m.

Supplementary Table S1. Differentially regulated genes in Pdgfr α EGFP⁺/Sca1⁺ fibroblasts The list of entities is compiled from genes that are differentially regulated in Pdgfr α EGFP⁺/Sca1⁺ fibroblasts compared to Pdgfr α EGFP⁺/Sca1⁻ (T test p<0.05, fold change >2). Some genes are represented by more than one entity. Entities are ranked by fold change and grouped according to positive (up, red) or negative (down, blue) regulation.

Table S1

Differentially regulated genes in PdgfraEGFP+ / Sca1+ adipogenic fibroblasts (T test p<0.05, fold change >2).
