

S5 Fig. Effect of *rmtA* on sclerotial production on Wickerham medium. *A. flavus* wild type (WT), $\Delta rmtA$, complementation (com) and O*E**rmtA* (OE) strains were point-inoculated on Wickerham medium and incubated for 7 days (A) and 17 days (B) at 30 °C. Plates were then sprayed with ethanol and micrographs of sclerotia were obtained approximately 1.5 cm from the center at 12.5X magnification using a Leica MZ75 dissecting microscope.
