

Figure S1. Risk of MM in relation to circulating total adiponectin levels estimated using a restricted cubic spline regression model with 4 knots. The odds ratio (OR) is represented by the solid line, and the upper and lower confidence intervals (CI) are represented by the dashed lines. A test for a linear relation was statistically significant ($P = 0.0007$), and there was no evidence of departure from linearity (P for non-linearity = 0.4).
