707 GeneMANIA measures significance by false discovery rate (FDR). Numbers of genes  
708 involved in a particular cellular function are shown, both within the resulting network and from  
709 the entire genome. The first 10 functions (of 87) are listed from overexpressed PD genes, and  
710 the first 10 (of 56) from overexpressed PD-D genes (A,C). All functions from underexpressed  
711 genes are shown (B,D).

740 Top alternatively spliced genes obtained by filtering for p < 0.01, dPSI > |0.2|, magnitude and  
 741 % observed > |0.8| (1.0 = 100%). The resulting lists contained 40 PD-D genes and 10 PD  
 742 genes. Finally, genes with the highest RPKM values were chosen for validation by qRT-PCR.
