

Supplementary Figure 1. Treatment scheme.

This picture represents an example of patient treatment. All target lesions were included in the irradiation field and received 10x3Gy over 2 weeks. Two of these (L1 and L5) were injected intratumorally (IT) and peritumorally (PT) with DT01 every other day. Arrows represent the administration sites. PT injections were administered in a clock wise manner. Circles show the assessed lesions.
