

**Figure S8: Quantification of LV particle incorporation levels of Her2-targeted G protein variants.** The data refer to the exemplary Western blot shown in Fig 8G. Chemiluminescence values for the glycoprotein G variants and those of p24 were quantified from three Western blots and three independently generated vector stocks, respectively. Values for the G variants normalized to those of p24 are shown (n=3; mean  $\pm$  standard error of the mean (SEM) are shown).
