

A**B****C**

Supplemental Figure S2. Bar plot showing the number of DEGs between different samples.

(A) Type 1 DEGs were genes differentially expressed between samples at two adjacent time points in the normal ovary and super ovary. (B) Type 2 DEGs were genes differentially expressed between the sample at a later time point and the sample at the earliest time point (N1 or S1) in the normal ovary and super ovary. (C) Type 3 DEGs were genes differentially expressed between samples from the super ovary and normal ovary at the same time points or the same developmental stages.
