

Supporting Information

Development of potent and selective *S. aureus* sortase A inhibitors based on peptide macrocycles

Inmaculada Rentero Rebollo, Shawna McCallin, Davide Bertoldo, José Manuel Entenza,
Philippe Moreillon and Christian Heinis*

Supplementary Methods

SrtA production

Vector pHTT14 was transformed into *E. coli* XL1-blue, the cells grown on selective ampicillin plates, and cells of a colony grown in LB (100 µg/ml ampicillin) until $OD_{600} = 0.5$. SrtA expression was induced by addition of 1 mM IPTG, and protein production was allowed for 4 h at 25 °C. Cells were harvested by centrifugation and resuspended in cold lysis buffer (30 mM NaH_2PO_4 , 300 mM NaCl, 0.1% Triton X-100, 50 µg/ml DNase, 100 µg/ml lysozyme, pH 7.4) by sonication. Lysates were cleared by centrifugation (9000 rpm, 4 °C, 1 hr). (His)₆-SrtA₂₆₋₂₀₆ was purified by nickel affinity chromatography using 30 mM NaH_2PO_4 , 300 mM NaCl, 10 mM imidazole, pH 7.4 as running buffer, and running buffer + 500 mM imidazole for elution, followed by size exclusion chromatography (PBS buffer) (Figure S3).

High-throughput sequencing

Phage vector was isolated from TG1 *E. coli* cells with a commercial plasmid purification kit (NucleoSpin Plasmid; Macherey-Nagel), and samples were prepared as previously described (Rebollo, et al., 2014), 100 ng phage vector DNA was amplified by PCR using primers containing adapter sequences and barcodes. The concentration of DNA was determined using a High Sensitivity DNA Assay Kit (Agilent), following the manufacturer's protocol. Ion Torrent sequencing was performed by the Lausanne Center of Genomic Technologies (University of Lausanne, Switzerland) on an Ion Personal Genome Machine (PGMTM) Sequencer, using an Ion Torrent 316TM chip.

Calculation of K_i

For IC_{50} s higher than 10 µM, the inhibitory constant K_i was calculated according to the equation of Cheng and Prusoff $K_i = IC_{50}/(1 + [S]_0/K_m)$, wherein IC_{50} is the functional strength of the inhibitor, $[S]_0$ is the total substrate concentration, and K_m is the Michaelis–Menten constant. The reported K_m values for LPETG substrates of SrtA are between 5 and 7 mM, and therefore $K_i \approx IC_{50}$. For IC_{50} s lower than 10 µM, a second series was performed using 1 µM enzyme and 50 µM substrate, and K_i s were calculated accordingly. For IC_{50} s lower than 3 µM in this second series, data was fitted to the Morrison equation, where V_i and V_0 are the reaction velocities in the presence and absence of inhibitor, respectively. E_0 and I_0 represent the total enzyme and

inhibitor concentration, respectively. K_i is the inhibition constant in the presence of fluorogenic substrate. Fitting curves were generated using OriginPro 8G software (OriginLab Corporation):

$$V_i/V_0 = 1 - \frac{E_0 + I_0 + K_i - \sqrt{(E_0 + I_0 + K_i)^2 - 4E_0I_0}}{2E_0}$$

Calculation of K_d

The dissociation constants (K_d) were determined by non-linear regression analyses of fluorescence polarization (F_p) versus total concentration of SrtA (P_T) using the following equation:

$$F_p = F_{p \min} + (F_{p \max} - F_{p \min}) \frac{L_T + P_T + K_D - \sqrt{(L_T + P_T + K_D)^2 - 4L_T P_T}}{2L_T}$$

$F_{p \min}$ and $F_{p \max}$ are the fluorescence polarization for the free peptide and the fully bound peptide respectively, and L_T is the total concentration of fluorescent ligand (200 nM). Fitting curves were generated using OriginPro 8G software (OriginLab Corporation).

Supplementary Figures

Figure S1. Resistance of bicyclic peptides to cleavage by SrtA. HPLC chromatograms of bicyclic peptide **2** (0.5 mM) incubated with SrtA (0.2 mM) for 0 and 5 hrs.

Figure S2. Specificity of a bicyclic peptide SrtA inhibitor. Fluorescence polarization of bicyclic peptide **2** labeled with fluorescein incubated with increasing concentrations of the indicated proteins.

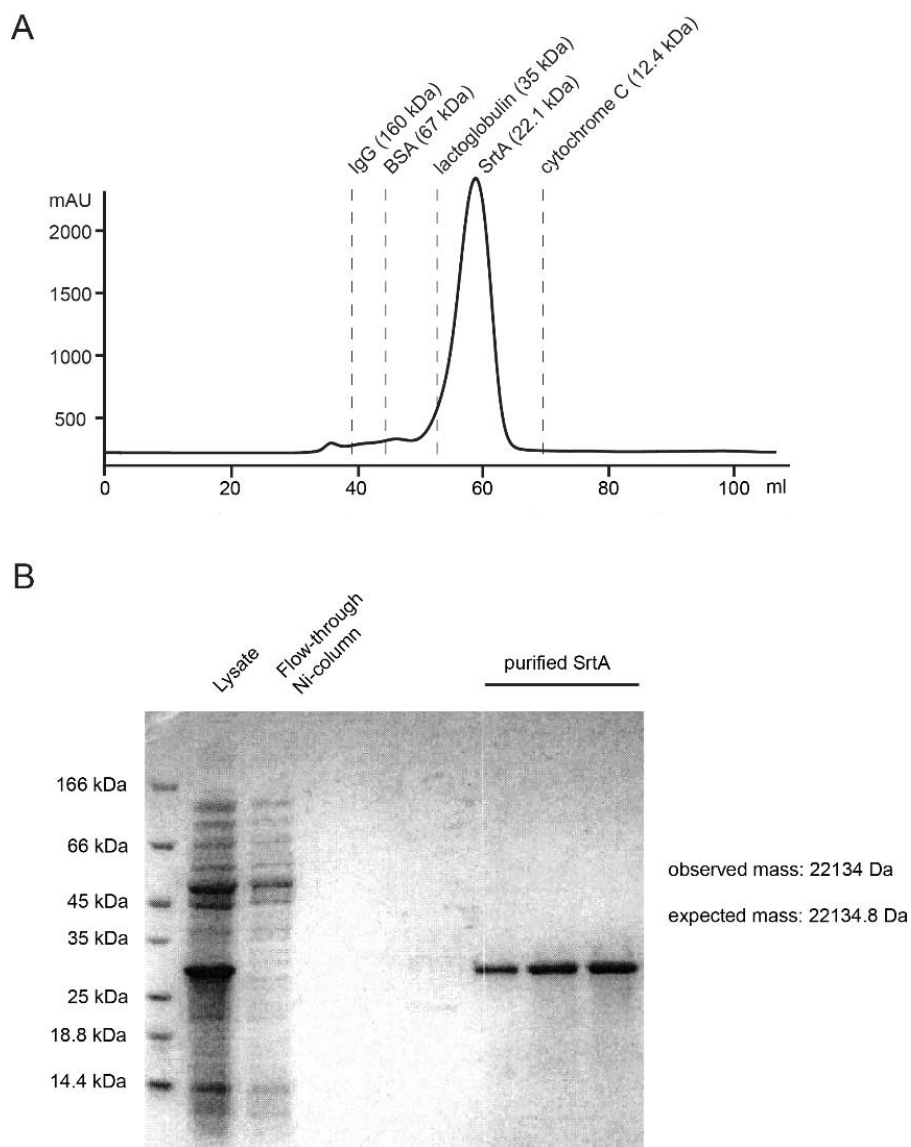

Figure S3. Purification of His6-SrtA_{ΔN}. (A) Size exclusion chromatogram after nickel-column purification. (B) Analysis of proteins by SDS-PAGE.
